

Organic Chemistry: Key Terminology and Reactions

Homologous Series

- Definition: A series of compounds with the same functional group and similar chemical properties
- Each member differs by a CH_2 unit
- Examples: Alkanes ($\text{C}_n\text{H}_{2n+2}$), Alkenes (C_nH_{2n}), Alcohols ($\text{C}_n\text{H}_{2n+1}\text{OH}$)
- Properties change gradually along the series (e.g., boiling point increases)

Saturated vs. Unsaturated Compounds

- Saturated: Contains only single bonds between carbon atoms
 - Example: Alkanes ($\text{C}_n\text{H}_{2n+2}$)
 - Less reactive, higher melting/boiling points

Chemical Nomenclature K.J. Thurlow, 2012-12-06 Chemical nomenclature can be a complicated subject As a result most works on the subject are rather dry textbooks and primarily consist of sets of instructions on how to name chemicals This practical book proves that chemical nomenclature can be interesting not just a necessary evil Written in a lively and engaging style by experts in their particular fields this new book provides a general discussion on why good clear nomenclature is needed It introduces the reader to the various forms of nomenclature without reading like a textbook Both systematic and trivial nomenclature systems are used widely and interchangeably in chemistry and this new book covers both areas For example systematic nomenclature in both the CAS and IUPAC styles is introduced These systems have many similarities but important differences which the chemist should be aware of Specialized naming systems are needed for polymers and natural products and these areas are covered in separate chapters The naming of elements is a very topical subject at the moment and so this is included to ensure a comprehensive coverage Covering a wide range of topics in the area of nomenclature and acting as an introduction to a varied field this book will be of interest to industrial chemists as well as students at senior undergraduate and postgraduate level
