Yuan, 1999-04-12 An up to date comprehensive guide to heterojunction bipolar transistor technology Owing to their superior performance in microwave and millimeter wave applications heterojunction bipolar transistors HBTs have become a major force in mobile and wireless communications This book offers an integrated treatment of SiGe GaAs and InP HBTs presenting a much needed overview of HBTs based on different materials systems their fabrication analysis and testing procedures Highly respected expert Jiann S Yuan discusses in depth the dc and RF performance and modeling of HBT devices including simulation thermal instability reliability low temperature and high temperature performance and HBT analog and digital circuits He provides step by step presentations of HBT materials including Si HBTs and III V and IV IV compound HBTs which are rarely described in the literature Also covered are device and circuit interaction as well as specific high speed devices in mobile and wireless communications This immensely useful guide to a rapidly expanding field includes more than 200 figures tables of different material systems in terms of their physical parameters and up to date experimental results culled from the latest research An essential resource for circuit and device designers in the semiconductor industry SiGe GaAs and InP Heterojunction Bipolar Transistors is also useful for graduate students in electrical engineering applied physics and materials science *Strained*

SI Heterojunction Bipolar Transistors Mouhsine Fjer, 2011 This dissertation addresses the world's first demonstration of strained Si Heterojunction Bipolar Transistors sSi HBTs. The conventional SiGe Heterojunction Bipolar Transistor SiGe HBT which was introduced as a commercial product in 1999 after its first demonstration in 1988 has become an established device for high speed applications. This is due to its excellent RF performance and compatibility with CMOS processing. It has enabled silicon based technology to penetrate the rapidly growing market for wide bandwidth and wireless telecommunications once reserved for more expensive III V technologies. SiGe HBTs is realised by the pseudomorphic growth of SiGe on a Si substrate which allows engineering of the base region to improve performance. In this way the base has a smaller energy band gap than the emitter which increases the gain. The energy band gap of SiGe reduces with increasing Ge composition but the maximum Ge composition is limited by the amount of strain that can be accommodated within a given base layer thickness. Therefore a new innovation is necessary to overcome this limitation and meet the continuous demand for high speed devices. Growing the SiGe base layer over a relaxed SiGe layer Strain Relaxed Buffer can increase the amount of Ge that can be incorporated in the base hence increasing the device performance. In this thesis experimental data is presented to demonstrate the realisation of sSi HBTs. The performance of this novel device has been also investigated and explained using TCAD tool.

Operation of Silicon-germanium Heterojunction Bipolar Transistors on Marco Bellini, 2009 Recently several SiGe HBT devices fabricated on CMOS compatible silicon on insulator SOI substrates. SiGe HBTs on SOI have been demonstrated combining the well known SiGe HBT performance with the advantages of SOI substrates. These new devices are especially interesting in the context of extreme environments highly challenging surroundings that lie outside commercial and even military electronics specifications. However fabricating HBTs on SOI substrates instead of traditional silicon bulk substrates requires extensive modifications to the structure of the transistors and results in significant trade offs. The present work investigates with measurements and TCAD simulations the performance and reliability of SiGe heterojunction bipolar transistors fabricated on silicon on insulator substrates with respect to operation in extreme environments such as at extremely low or extremely high temperatures or in the presence of radiation both in terms of total ionizing dose and single effect upset.

Silicon-Germanium Heterojunction Bipolar Transistors for Mm-wave Systems Technology, Modeling and Circuit Applications Niccolò Rinaldi, Michael Schröter, 2022-09-01 The semiconductor industry is a fundamental building block of the new economy there is no area of modern life untouched by the progress of nanoelectronics. The electronic chip is becoming an ever increasing portion of system solutions starting initially from less than 5% in the 1970 microcomputer era to more than 60% of the final cost of a mobile telephone. 50% of the price of a personal computer representing nearly 100% of the functionalities and 30% of the price of a monitor in the early 2000s. Interest in utilizing the sub mm wave frequency spectrum for commercial and research applications has also been steadily increasing. Such applications which constitute a diverse but sizeable future market span a large variety of areas such as

health material science mass transit industrial automation communications and space exploration Silicon Germanium Heterojunction Bipolar Transistors for mm Wave Systems Technology Modeling and Circuit Applications provides an overview of results of the DOTSEVEN EU research project and as such focusses on key material developments for mm Wave Device Technology It starts with the motivation at the beginning of the project and a summary of its major achievements The subsequent chapters provide a detailed description of the obtained research results in the various areas of process development device simulation compact device modeling experimental characterization reliability sub mm wave circuit design and systems
