Silicon Paul Siffert, Eberhard Krimmel, 2013-03-09 Silicon The evolution and development of humanity are commonly characterized by the key words Stone Age Bronze Age and Iron Age that is characterized by materials Curse or benefit to mankind The discovery and utilization of semiconductors particularly of silicon revolutionized our living conditions society social life and maxims in a few years even more than what happened during all the material specified periods before Perhaps one day our descendants will call the period at whose beginning we live the Silicon Age However to be correct the present period is characterized of the discovery and development of a whole bunch of new materials and their utilization These materials are new alloys ceramics the plastics and synthetics produced by organic chemistry composites biomaterials and the materials of microelectronics nanotechnology and space science The materials of microelectronics are silicon other elemental semiconductors compound semiconductors and organic semiconductors With regard to the interdependences of these materials and their utilization silicon plays a central role as one of the base materials for electronics Have we lived in the Silicon Age for only half a century and already jumped into a new age of synthetic organic materials for electronics We do not know The first intensive work on silicon started more than 50 years ago One of the European semiconductor laboratories was installed by the industry in a centuries old little countryside castle in

Pretzfeld in the north east of Bavaria Germany **VLSI Memory Chip Design** Kiyoo Itoh, 2013-04-17 The VLSI memory era truly began when the first production of semiconductor memory was announced by IBM and Intel in 1970 The announcement had a profound impact on my research at Hitachi Ltd and I was forced to change fields from magnetic thin film to semiconductor memory This change was so exceptionally sudden and difficult I felt like a victim of fate Looking back however I realize how fortunate I was I have witnessed an unprecedented increase in memory capacity DRAM for example has had a 6 order increase in the last three decades from the 1 Kb level in 1970 to the 1 Gb level today I have contributed to this progress with full involvement in memory chip development over my career Such rapid progress would have been impossible without many of the inventions and innovative technologies and without the effort of many talented people Unfortunately few systematic books on memory chip design have been written by experts This is a result of two factors the difficulty of involving university professors because of rapidly changing technology requiring huge investments and development resources and a shortage of time on the part of chip designers in industry due to severe competition in the memory chip business Therefore LSI memory chip design has been isolated from the outside preventing a deeper understanding of the technology This book is based on my 30 year memory chip particularly DRAM design career
