**Handbook of Sample Preparation for Scanning Electron Microscopy and X-Ray Microanalysis** Patrick Echlin, 2011-04-14 Scanning electron microscopy SEM and x ray microanalysis can produce magnified images and in situ chemical information from virtually any type of specimen The two instruments generally operate in a high vacuum and a very dry environment in order to produce the high energy beam of electrons needed for imaging and analysis With a few notable exceptions most specimens destined for study in the SEM are poor conductors and composed of beam sensitive light elements containing variable amounts of water In the SEM the imaging system depends on the specimen being sufficiently electrically conductive to ensure that the bulk of the incoming electrons go to ground The formation of the image depends on collecting the different signals that are scattered as a consequence of the high energy beam interacting with the sample Backscattered electrons and secondary electrons are generated within the primary beam sample interactive volume and are the two principal signals used to form images The backscattered electron coefficient increases with increasing atomic number of the specimen whereas the secondary electron coefficient is relatively insensitive to atomic number This fundamental difference in the two signals can have an important effect on the way samples may need to be prepared The analytical system depends on collecting the x ray photons that are generated within the sample as a consequence of interaction with the same high energy beam of primary electrons used to produce images

**Plant Nutrition — from Genetic Engineering to Field Practice** J. Barrow, 2012-12-06 Plant Nutrition From Genetic Engineering to Field Practice the 12th International Colloquium on Plant Nutrition is the latest in a series which began in 1954 Early meetings were mainly concerned with the practical problems of soil fertility with soil assessment fertilizer requirements and methods of analysis As the colloquia have progressed the emphasis has slowly changed The practical problems are still important but there is increasing emphasis on plant physiology plant biochemistry

membrane biochemistry and even on the chemistry of genes which control the proteins which transfer nutrient ions to the inside of cells The meetings therefore provide a valuable opportunity for each half of the science of plant nutrition to interact with and learn from the other half This volume begins with five papers which review current knowledge in important fields the rhizosphere molecular biology electron microscopy location and function of elements in vivo and modelling nutrient responses in the field These themes are continued in groups of shorter papers which follow In addition there are sections on nutrient dynamics and partitioning diagnostic techniques plant survival strategies mycorrhizas and on nutrients such as P N S K Ca Mg and micronutrients A large section is devoted specifically to boron reflecting the considerable current interest in this element In total there are 177 refereed papers providing both a broad overview and a detailed picture of the latest developments in pure and applied plant nutrition
