Abstract: This paper presents an environment for solving Prolog problems which has been implemented as a module for the virtual laboratory VILAB. During the problem solving processes the learners get fast adaptive feedback. As a result analysing the learner's actions the system suggests the use of suitable auxiliary predicates which will also be checked for proper implementation. The focus of the environment has been set on robustness and the integration in VILAB.

Introduction

The Intelligent Information and Communication Systems group at the distance university Fern-Universität in Hagen has developed a virtual laboratory (VILAB¹) for computer science focused on problem solving [Lüt04]. It supports interactive problem solving in computer science with access to complex software-tools. The problems given in VILAB are divided into different domains of computer science (e.g. relational databases, programming, natural language processing). The learner's solutions for these problems can automatically be analysed and a tutoring component immediately gives feedback for improvements. After this the learners modify their solution and a further analysis starts, etc. VILAB provides a learner model, which consists among other things of domain specific knowledge of the student, a distance between the students solution and the correct solution and the change of this distance for each task.

This paper presents a mechanism for analysing solutions in the field of Prolog programming. In the first part of the paper we explain how the solutions are judged, in the second part we show how the analysing component is implemented, and finally we give an outlook on further work.

Analysis of Prolog Programs

The analysis of a solution is done in several steps:

- (1) At first, a syntax check is performed. Compared to the regular Prolog compiler, it produces error messages which are easier to understand for Prolog beginners. In addition, it also explains how to correct typical syntax errors.
- (2) In the next step, the program is checked for so-called »undesirable commands«. This is necessary, since the full set of Prolog commands is made available to the learners, but some commands for the interaction with the operating system or the file system can be used (unintentional) in a destructive way. Due to Prolog's feature of dynamic command creation, the check for undesirable commands takes place also during the program run.

Problem Solving With Prolog John Stobo, 2004-01-14 This is a practical introduction to PROLOG for the reader with little experience It presents problem solving techniques for program development in PROLOG based on case analysis and the use of a toolkit of PROLOG techniques The development of larger scale programs and the techniques More for solving them using the methodology and tools described through the presentation of several case studies of typical programming problems is also discussed **Start Problem-solving with PROLOG** Tom Conlon, 1985 **Programming in Prolog** William F.
