Problem-directed And Medical Information Systems:

Problem-directed and Medical Information Systems Society for Advanced Medical Systems, 1973 **Clinical Information Systems** Bruce I. Blum, 2012-12-06 As its name implies this book deals with clinical information systems. The clinical information system or CIS is an automated system with a long term database containing clinical information used for patient care. This definition excludes business systems, no clinical data, physiological monitoring systems, no long term database, and many research systems not used in patient care. The theses of this book are: a) that CIS technology is mature, b) that the CIS will have a major impact upon patient care and the health delivery system, and c) that the number of commercial systems which now offer these potential benefits is very small. The objective of this book is to establish the above theses and thereby inform both users and developers, b) increase the demand for more sophisticated products, and finally c) provide marketplace incentives to advance the state of the art. The CIS is an application of computer technology for a specific class of problems. Its development requires a knowledge of the technology with an understanding of the application area. As with any tool-based application, the scope of the product will be limited by the capability of the tool. In the case of the CIS, reliable computers with comprehensive database facilities became commercially available in the early 1970s. By the mid 1970s, there was a maturation of the literature and evaluations of 5 years' use began to appear. As will be shown, there have been surprisingly few new ideas introduced since the 1970s. **The History of Medical Informatics in the United States**

Morris F. Collen, Marion J. Ball, 2015-10-08 This is a meticulously detailed chronological record of significant events in the history of medical informatics and their impact on direct patient care and clinical research, offering a representative sampling of published contributions to the field. The History of Medical Informatics in the United States has been restructured within this new edition, reflecting the transformation medical informatics has undergone in the years since 1990. The systems that were once exclusively institutionally driven (hospital, multihospital, and outpatient information systems) are today joined by systems that are driven by clinical subspecialties (nursing, pathology, clinical laboratory, pharmacy, imaging, and more). At the core is the person, not the clinician, not the institution, whose health all these systems are designed to serve. A group of world-renowned authors have joined forces with Dr. Marion Ball to bring Dr. Collen's incredible work to press. These recognized leaders in medical informatics, many of whom are recipients of the Morris F. Collen Award in Medical Informatics and were friends of or mentored by Dr. Collen, carefully reviewed, edited, and updated his draft chapters. This has resulted in the most thorough history of the subject imaginable and also provides readers with a roadmap for the subject well into later in the century. *National Library of Medicine Current Catalog* National Library of Medicine (U.S.), 1973 First multi-year

cumulation covers six years, 1965-70. **Computer Medical Databases** Morris F. Collen, 2011-10-20 Chapter 1 offers an overview of the basic computer technology. Each succeeding chapter describes the problems in medicine followed by a review in chronological sequence of why and how computers were applied to try to meet these problems. Only the technical aspects

of computer hardware software and communications are discussed as they are necessary to explain how the technology was applied This approach generally led to defining the objectives for applications of medical informatics At the end of each chapter the author summarizes his personal views and interpretations of the chapter contents Although the concurrent evolution of medical informatics in Canada Europe and Japan certainly influenced workers in the United States the scope of this historical review is limited to the development of medical informatics within the United States Furthermore this review is limited to electronic digital computers it excludes mechanical analog and hybrid computers

Family Medicine J. L. Buckingham, E. P. Donatelle, W. E. Jacott, M. G. Rosen, Robert B. Taylor, 2013-06-29 JOHN S MILLIS In 1966 the Citizens Commission on Graduate Medical Education observed that the explosive growth in biomedical science and the consequent increase in medical skill and technology of the twentieth century had made it possible for physicians to respond to the episodes of illness of patients with an ever increasing effectiveness but that the increase in knowledge and technology had forced most physicians to concentrate upon a disease entity an organ or organ system or a particular mode of diagnosis or therapy As a result there had been a growing lack of continuing and comprehensive patient care The Commission expressed the opinion that Now in order to bring medicine's enhanced diagnostic and therapeutic powers fully to the benefit of society it is necessary to have many physicians who can put medicine together again The Commission proceeded to recommend the education and training of substantial numbers of Primary Physicians who would by assuming primary responsibility for the patient's welfare in sickness and in health provide continuing and comprehensive health care to the citizens of the United States In 1978 it is clear that the recommendation has been accepted by the public the medical profession and medical education There has been a vigorous response in the development of family medicine and in the fields of internal medicine pediatrics and obstetrics One is particularly impressed by the wide acceptance on the part of medical students of the concept of the primary physician Dr John S *Information Retrieval & Library Automation Letter*, 1971

The Perception of Visual Information William Thomson, Peter N.T. Wells, 2013-03-09 Human knowledge is primarily the product of experiences acquired through interactions of our senses with our surroundings Of all the senses vision is the one relied on most heavily by most people for sensory input about the environment Visual interactions can be divided into three processes 1 detection of visual information 2 recognition of the external source of the information and 3 interpretation of the significance of the information These processes usually occur sequentially although there is considerable interdependence among them With our strong dependence on the processes of visual interactions we might assume that they are well characterized and understood Nothing could be further from the truth Human vision remains an enigma in spite of speculations by philosophers for centuries and more recently of attention from physicists and cognitive

and experimental psychologists How we see and how we know what we see remains an unsolved mystery that challenges some of the most creative scientists and cognitive specialists **Computers for Medical Office and Patient Management** Stacey B.
