

of physical properties, Bridgman was constantly concerned with the theoretical meaning of the properties that he had been studying. There are a good many papers on the theoretical implications of what he had found, going back as far as his paper in the *Reviews of Modern Physics* in 1935, "Theoretically interesting aspects of high pressure phenomena," and extending on to much later papers. These general review articles would amply repay study by any young theorist of the solid state; we are very far from having explained all the phenomena Bridgman felt were interesting and significant.

By the time we get to the last volume, we are coming to topics of recent interest. We come to the very high-pressure range, where the pressure was not purely hydrostatic (for there are no liquids that remain liquid at these extreme pressures), and there-

fore where it is much harder to estimate the pressure, but where nevertheless many interesting phenomena appear. We come to papers on such popularly interesting topics as synthetic diamonds, in which Bridgman made some of the early steps. We learn that he made measurements on the compressibility and phase transitions of plutonium during the wartime Manhattan District, though the results could not be reported until much later. But also we follow up to his last years additional measurements on less exciting topics, but nonetheless topics on which he had been working for many years.

The concluding paper was not intended for this volume by Professor Bridgman. It was his introductory essay, "General outlook on the field of high-pressure research," for the book *Solids Under Pressure*, edited by W. Paul and D. M. Warschauer, two

of his former students, and published by McGraw-Hill in 1963. That book is a monograph on high pressure, mostly written by other workers. It is an eloquent demonstration of the fact that after a career of more than 50 years, Bridgman's field of high pressure has at last ceased to be a one-man show, and has come to represent a technique so familiar that now many laboratories are equipped to reach pressures that even Bridgman, early in his career, would have regarded as impossible. It is now a valuable and established field of physics, one for which Bridgman received his Nobel prize, and a field that in all probability would not soon have reached anything like its present mature state if this uniquely able, ingenious, and persistent man had not built it up.

Paleoclimatology: Controversy, Chaos, and Confrontation

Paleoclimatology today is a snipe hunt, and one is very likely to find himself holding the bag, wondering where all the continents went. At the moment, it is also chaos, as any system without constraints must be, and one is reminded of the traffic jam that results when the red light on the street corner fails to function. The traffic problems caused by drifting continents have seldom been more evident than in **Problems in Paleoclimatology** [Inter-science (Wiley), New York, 1965. 705 pp. \$18], for though there is far more to paleoclimatology than continental drift, that fact is, in this volume, frequently brushed aside by a wandering pole.

The strong slant of the volume is no failing of its editor, A. E. M. Nairn, who, despite the handicap of extremely

heterogeneous subject matter, has succeeded in introducing a measure of order. Rather it was inherent in the symposium whose proceedings this book contains. Perhaps it was inevitable because of the necessity of fixing some physical configuration of the continents, ocean basins, and poles before real progress can be expected in paleoclimatology and because the symposium was held in Newcastle-upon-Tyne, the home port of many a drifting continent. In any case, the bias, once recognized, in no way impairs the utility of the volume and, in fact, lends interest for, after all, what is more interesting than the controversial?

Perhaps—and this is a serious problem—the existing chaos in paleoclimatology has come about because the field lacks tangible form. There is no such

thing as paleoclimatology in its own right. Almost no one professes to be a paleoclimatologist, though many excellent geologists, biologists, meteorologists, chemists, and physicists profess an interest. Scientists who work in the field often do so on an occasional basis and commonly as a by-product of some other interest. The result is both the strength and the weakness of the subject: strength because paleoclimatology interacts with and draws from such a diversity of flanking disciplines; weakness because few of its practitioners can comprehend its whole structure and because few critical studies designed to solve uniquely paleoclimatic problems are ever made.

Despite shortcomings that this book inevitably shares with many a symposium volume, it carries an underlying tone of excitement. It is, I think, the excitement of an area of science beginning to recognize that it is a focal point for investigators in many fields. A great value of the NATO Paleoclimate Symposium and of this book is that both brought together the ideas of students working in many fields. As a result, one's imagination is stimulated, and one's admiration aroused, by the diverse and clever means by which paleoclimatic problems can be approached. The price paid for this benefit is that few will be able to read the entire book with full

Global Palaeoclimate of the Late Cenozoic V.A. Zubakov, I.I. Borzenkova, 1990-03-20 This is a detailed description of the history and chronology of global climate based on event signal stratigraphy The history of global climate is described for the last fifty million years with the description for the last one million years in detail Climatostratigraphic sequences of twelve key regions are taken as a basis eight of them situated in the USSR territories Chronology of climatic events of the Pleistocene Pliocene and Miocene is developed based on palaeomagnetic and radiometric data The authors version of its correlation with oxygen isotope scales of deep sea sediments is given Theoretical problems of climatic stratigraphy and palaeoclimatology are discussed in particular the causes of climatic change The Northern Hemisphere palaeoclimatic reconstructions are made for the Holocene Eemian and Pliocene temperature optima considered as possible palaeoanalogues of climate of the 21st Century The book is intended primarily for a wide circle of scientific workers palaeoclimatologists and palaeogeographers but will also interest geologists biologists palaeomagnetologists and archaeologists

Paleoclimatology Colin P. Summerhayes, 2020-09-08 Life on our planet depends upon having a climate that changes within narrow limits not too hot for the oceans to boil away nor too cold for the planet to freeze over Over the past billion years Earth's average temperature has stayed close to 14-15°C oscillating between warm greenhouse states and cold icehouse states We live with variation but a variation with limits Paleoclimatology is the science of understanding and explaining those variations those limits and the forces that control them Without that understanding we will not be able to foresee future change accurately as our population grows Our impact on the planet is now equal to a geological force such that many geologists now see us as living in a new geological era the Anthropocene Paleoclimatology describes Earth's passage through the greenhouse and icehouse worlds of the past 800 million years including the glaciations of Snowball Earth in a world that was then free of land plants It describes the operation of the Earth's thermostat which keeps the planet fit for life and its control by interactions between greenhouse gases land plants chemical weathering continental motions volcanic activity orbital change and solar variability It explains how we arrived at our current understanding of the climate system by reviewing the contributions of scientists since the mid 1700s showing how their ideas were modified as science progressed And it includes reflections based on the author's involvement in palaeoclimatic research The book will transform debate and set the agenda for the next generation of thought about future climate change It will be an invaluable course reference for undergraduate and postgraduate students in geology climatology oceanography and the history of science A real tour de force An outstanding summary not only of the science and what needs to be done but also the challenges that are a consequence of psychological and cultural baggage that threatens not only the survival of our own species but the many others we are eliminating as well Peter Barrett Emeritus Professor of Geology Antarctic Research Centre Victoria University of Wellington New Zealand What a remarkable and wonderful synthesis it will be a wonderful source of paleoclimate
