The resistivity of homogeneous $(\text{La}_{1-x}\text{Y}_x)\text{Ce}_x\text{Al}_3$ alloys was measured. From the quadratic temperature dependence of the incremental resistivity observed at low temperatures an enhancement of the Kondo temperature by two orders of magnitude is inferred. A magnetic-nonmagnetic transition was observed in dilute $(\text{Y}_{1-x}\text{Ce}_x)\text{Al}_3$ alloys ($x = 0.07$).

The low temperature properties of CeAl_3 , not yet completely understood are the subject of several contributions to this conference. In order to study the role of the Kondo effect in this system we have started a program in which the magnetic behavior of diluted CeAl_3 is investigated as a function of the lattice parameter.

In this paper we present preliminary resistivity data between 1.5 and 300 K of pseudo-binary solutions of CeAl_3 in the isostructural $(\text{La}_{1-x}\text{Y}_x)\text{Al}_3$ matrices. The same moderate amount of CeAl_3 ($x = 0.15$) was chosen to provide a clear extraction of the magnetic resistivities from the residual and electron phonon resistivities. The latter were obtained in independent measurements from the corresponding nonmagnetic matrices. X-ray analysis reveals that all of the alloys under investigation are of single phase and that the mean lattice parameter of the matrices decreases linearly with x from $a = 8.15 \text{ \AA}$ ($x = 0$) to $a = 7.86 \text{ \AA}$ ($x = 1$). Therefore, CeAl_3 ($a = 8.06 \text{ \AA}$) can be either expanded or contracted by solution in an appropriate $(\text{La}_{1-x}\text{Y}_x)\text{Al}_3$ matrix.

Details concerning preparation of the polycrystalline samples and experimental procedures will be published elsewhere [1]. We note here that the relative accuracy of the resistivity measurement is 2×10^{-4} whereas an absolute error of order 10% due to the uncertainty of the geometric factor cannot be avoided.

In fig. 1a the resistivity of five $(\text{La}_{1-x}\text{Y}_x)\text{Ce}_{0.15}\text{Al}_3$ samples is given as a function of temperature on a logarithmic scale. There exists a resistivity minimum, which shifts to higher temperatures upon increasing Y-

Radioactive Fallout after Nuclear Explosions and Accidents Y.A. Izrael, 2002-06-20

To achieve successful solutions to the problems resulting from local distant and global radioactive fallout after nuclear explosions and accidents and to achieve successful retrospective analyses of the radiation conditions from recent observations certain information is needed the distribution of the exposure dose rate in the atmosphere and in a country the distribution of radionuclides in natural environments and the nuclide composition of the radioactive fallout the features of formation of the aerosol particle carriers of the radioactivity and of the nuclide distribution of the particles of different sizes formed under different conditions the processes involved in the migration of radioactive products in different zones and environments the external and internal effects of nuclear radiation on human beings This monograph is devoted to a number of these problems namely to studies of the radioactive fallout composition the formation of the aerosol particles that transport the radioactive products and to the analysis of the external radiation doses resulting from nuclear explosions and or accidents Problems of restoration and rehabilitation of contaminated land areas are also touched upon in the monograph To solve such problems one requires knowledge of the mobility of radionuclides an understanding of their uptake by plants their transportation within the food chain and finally their uptake by animal and or human organisms The results of many years of study of radioactive fallout from atmospheric and underground nuclear explosions and accidents are summarized in this book It is intended for various specialists geophysicists ecologists health experts and inspectors as well as those who are concerned with radioactive contamination of natural environments
