Process Modelling and Model Analysis Ian T. Cameron, Katalin Hangos, 2001-05-23 Process Modelling and Model Analysis describes the use of models in process engineering Process engineering is all about manufacturing of just about anything To manage processing and manufacturing systematically the engineer has to bring together many different techniques and analyses of the interaction between various aspects of the process For example process engineers would apply models to perform feasibility analyses of novel process designs assess environmental impact and detect potential hazards or accidents To manage complex systems and enable process design the behavior of systems is reduced to simple mathematical forms This book provides a systematic approach to the mathematical development of process models and explains how to analyze those models Additionally there is a comprehensive bibliography for further reading a question and answer section and an accompanying Web site developed by the authors with additional data and exercises Introduces a structured modeling methodology emphasizing the importance of the modeling goal and including key steps such as model verification calibration and validation Focuses on novel and advanced modeling techniques such as discrete hybrid hierarchical and empirical modeling Illustrates the notions tools and techniques of process modeling with examples and advances applications

Process Modelling and Simulation César de Prada, Constantinos Pantelides, José Luis Pitarch, 2019-09-23 Since process models are nowadays ubiquitous in many applications the challenges and alternatives related to their development validation and efficient use have become more apparent In addition the massive amounts of both offline and online data available today open the door for new applications and solutions However transforming data into useful models and information in the context of the process industry or of bio systems requires specific approaches and considerations such as new modelling methodologies incorporating the complex stochastic hybrid and distributed nature of many processes in particular The same can be said about the tools and software environments used to describe code and solve such models for their further exploitation Going well beyond mere simulation tools these advanced tools offer a software suite built around the models facilitating tasks such as experiment design parameter estimation model initialization validation analysis size reduction discretization optimization distributed computation co simulation etc This Special Issue collects novel developments in these topics in order to address the challenges brought by the use of models in their different facets and to reflect state of the art developments in methods tools and industrial applications

Process Modelling Bernd Scholz-Reiter, Hans-Dietrich Stahlmann, Arnim Nethe, 2012-12-06 A process model is very often used for system analysis design and management in various application areas Using a process model has the advantage that it has only to be as precise as necessary within the parameters of the individual field of application whereas the precision externally is less important This makes process modeling easier and open for structuring The contributions deal with different approaches to process modelling especially in the areas of business process modelling logistics and production processes and water systems

Product and Process Modelling Ian T. Cameron, Rafiqul Gani, 2011-09-12 This book covers the area of product and process modelling via a case study approach. It addresses a wide range of modelling applications with emphasis on modelling methodology and the subsequent in-depth analysis of mathematical models to gain insight via structural aspects of the models. These approaches are put into the context of life cycle modelling where multiscale and multiform modelling is increasingly prevalent in the 21st century. The book commences with a discussion of modern product and process modelling theory and practice followed by a series of case studies drawn from a variety of process industries. The book builds on the extensive modelling experience of the authors who have developed models for both research and industrial purposes. It complements existing books by the authors in the modelling area. Those areas include the traditional petroleum and petrochemical industries to biotechnology applications, food, polymer and human health application areas. The book highlights the important nature of modern product and process modelling in the decision-making processes across the life cycle. As such, it provides an important resource for students, researchers and industrial practitioners. Ian Cameron is Professor in Chemical Engineering at the University of Queensland with teaching, research and consulting activities in process systems engineering. He has a particular interest in process modelling, dynamic simulation and the application of functional systems perspectives to risk management, having extensive industrial experience in these areas. He continues to work closely with industry and government on systems approaches to process and risk management issues. He received his BE from the University of New South Wales, Australia, and his PhD from Imperial College London. He is a Fellow of IChemE. Rafiqul Gani is a Professor of Systems Design at the Department of Chemical and Biochemical Engineering, Technical University of Denmark, and the director of the Computer Aided Product Process Engineering Center (CAPEC). His research interests include the development of computer-aided methods and tools for modelling, property estimation and process product synthesis and design. He received his BSc from Bangladesh University of Engineering and Technology in 1975 and his MSc in 1976 and PhD in 1980 from Imperial College London. He is the editor in chief of Computers and Chemical Engineering journal and Fellow of IChemE as well as AIChE. Product and process modelling: a wide range of case studies are covered. Structural analysis of model systems, insights into structure and solvability, analysis of future developments, potential directions and significant research and development problems to be addressed.

interaction modelling and offers an enhanced communication concept In order to render models executable the semantics of the modelling language needs to be described rigorously enough to prevent deviating interpretations by different tools For this reason the semantics of the necessary concepts introduced in this book are defined using the Abstract State Machine ASM method Finally the authors show how the different parts of the model fit together using a simple example process and introduce the enhanced Process Platform eP2 architecture which binds all the different components together The resulting method is named Hagenberg Business Process Modelling H BPM after the Austrian village where it was designed The motivation for the development of the H BPM method stems from several industrial projects in which business analysts and software developers struggled with redundancies and inconsistencies in system documentation due to missing integration The book is aimed at researchers in business process management and industry 4 0 as well as advanced professionals in these areas

Business Process Modelling Bernd Scholz-Reiter, Eberhard Stickel, 2012-12-06 Today information is considered to be a valuable company resource that has to be planned coordinated and documented Business processes need to be treated in the same way Moreover significant potential

for improvement may lie in optimizing these processes As a consequence information should be collected and suitably modelled and business processes need to be analyzed and redesigned Business modelling usually deals with different views of a company The data view is concerned with information structures the functional view analyzes tasks and procedures the process view links different functions by analyzing workflows and events triggering them while the organizational view is concerned with the structure of the company under investigation These views should not however be treated in an isolated manner The key to success is to deal with the interaction between them Hence business modelling should provide an integrated view of all relevant informational functional organizational and workflow issues One of the most significant problems results from the complexity of the modelling task Modelling tools are required and are to be used in combination with other close methodologies and applications Suitable generalizations and or new methodologies need to be developed

Process Modelling, Identification, and Control Ján Mikleš, Miroslav Fikar, 2007-06-30 Control and automation in its broadest sense plays a fundamental role in process industries Control assures stability of technologies disturbance attenuation safety of equipment and environment as well as optimal process operation from economic point of view This book intends to present modern automatic control methods and their applications in process control in process industries The processes studied mainly involve mass and heat transfer processes and chemical reactors It is assumed that the reader has already a basic knowledge about controlled processes and about differential and integral calculus as well as about matrix algebra Automatic control problems involve mathematics more than it is usual in other engineering disciplines The book treats problems in a similar way as it is in mathematics The problem is formulated at first then the theorem is stated Only necessary conditions are usually proved and sufficiency is left aside as it follows from the physical nature of the problem solved This helps to follow the engineering character of problems The intended audience of this book includes graduate students but can also be of interest to practising engineers or applied scientists
