Parallel Evolution of Parallel Processors G. Lerman,L. Rudolph,2013-03-07 Study the past if you would divine the future CONFUCIUS A well written organized and concise survey is an important tool in any newly emerging field of study This present text is the first of a new series that has been established to promote the publications of such survey books A survey serves several needs Virtually every new research area has its roots in several diverse areas and many of the initial fundamental results are dispersed across a wide range of journals books and conferences in many different sub fields A good survey should bring together these results But just a collection of articles is not enough Since terminology and notation take many years to become standardized it is often difficult to master the early papers In addition when a new research field has its foundations outside of computer science all the papers may be difficult to read Each field has its own view of elegance and its own method of presenting results A good survey overcomes such difficulties by presenting results in a notation and terminology that is familiar to most computer scientists A good survey can give a feel for the whole field It helps identify trends both successful and unsuccessful and it should point new researchers in the right direction MPI--the Complete

High Performance Computing 2012 Alexey Cheptsov,Steffen Brinkmann,José Gracia,Michael M. Resch,Wolfgang E.

Nagel,2013-06-12 The latest advances in the High Performance Computing hardware have significantly raised the level of available compute performance At the same time the growing hardware capabilities of modern supercomputing architectures have caused an increasing complexity of the parallel application development Despite numerous efforts to improve and simplify parallel programming there is still a lot of manual debugging and tuning work required This process is supported by special software tools facilitating debugging performance analysis and optimization and thus making a major contribution to the development of robust and efficient parallel software This book introduces a selection of the tools which were presented and discussed at the 6th International Parallel Tools Workshop held in Stuttgart Germany 25 26 September 2012

Model-Based Testing of Reactive Systems Manfred Broy, Bengt Jonsson, Joost-Pieter Katoen, Martin Leucker, Alexander Pretschner, 2005-07-11 Testing is the primary hardware and software verification technique used by industry today. Usually it is ad hoc, error prone, and very expensive. In recent years, however, many attempts have been made to develop more sophisticated formal testing methods. This coherent book provides an in-depth assessment of this emerging field, focusing on formal testing of reactive systems. This book is based on a seminar held in Dagstuhl Castle, Germany, in January 2004. It presents 19 carefully reviewed and revised lectures given at the seminar in a well-balanced way, ensuring competent complementary coverage of all relevant aspects. An appendix provides a glossary for model-based testing and basics on finite state machines and on labelled transition systems. The lectures are presented in topical sections on testing of finite state machines, testing of labelled transition systems, model-based test case generation tools, and case studies, standardized test notation, and execution architectures and beyond testing.

Advanced Software Technologies for Post-Peta Scale Computing Mitsuhisa Sato, 2018-12-06 Covering research topics from system software such as programming languages, compilers, runtime systems, operating systems, communication middleware, and large scale file systems, as well as application development support software and big data processing software, this book presents cutting edge software technologies for extreme scale computing. The findings presented here will provide researchers in these fields with important insights for the further development of exascale computing technologies. This book grew out of the post-peta CREST research project funded by the Japan Science and Technology Agency, the goal of which was to establish software technologies for exploring extreme performance computing beyond petascale computing. The respective were contributed by 14 research teams involved in the project. In addition to advanced technologies for large scale numerical computation, the project addressed the technologies required for big data and graph processing, the complexity of memory hierarchy, and the power problem. Mapping the direction of future high performance computing was also a central priority.

Symbolic Parallelization of Nested Loop Programs Alexandru-Petru Tanase, Frank Hannig, Jürgen Teich, 2018-02-22 This book introduces new compilation techniques using the polyhedron model for the resource adaptive parallel execution of loop programs on massively parallel processor arrays. The authors show how to compute optimal symbolic assignments and parallel schedules of loop iterations at compile time for cases where the number of available cores becomes known only at runtime. The compile runtime symbolic parallelization approach the authors describe reduces significantly the runtime overhead compared to dynamic or just in time compilation. The new on demand fault tolerant loop processing approach described in this book protects loop nests for parallel execution against soft errors.
