Primate Hearing and Communication Rolf M. Quam, Marissa A. Ramsier, Richard R. Fay, Arthur N. Popper, 2017-09-04 Presents a comprehensive review of nonhuman primate audition and vocal communication These are obviously intimately related topics but are often addressed separately The hearing abilities of primates have been tested experimentally in a large number of species across the primate order and these studies have revealed both consistent patterns as well as interesting variation within and between taxonomic groups Recent studies have shed light on how variation in anatomical structures along the auditory pathway relates to variation in auditory sensitivity At the same time ongoing studies of vocal communication in wild primate populations continue to reveal new insights into the social and environmental contexts of many primate calls and the range of known primate vocalizations has increased dramatically with the development of more sophisticated and accessible auditory equipment and software that enables the recording and analysis of higher fidelity and broader band recordings including documenting very high frequency i.e. ultrasound vocalizations Historically the relative importance of primate calls has been evaluated qualitatively by the perception of the researcher but new methods and approaches now enable a greater appreciation for how signals are used and perceived by the primates in question The integration of anatomical and behavioral data on acoustic communication and the environmental correlates thereof has significant potential for reconstructing behavior in the fossil record This confluence of factors and accumulating evidence for the sophistication and complexity in both the signal and its interpretation indicate that a book synthesizing this information across primates is warranted and represents an important contribution to the literature

Infrasound Monitoring for Atmospheric Studies Alexis Le Pichon, Elisabeth Blanc, Alain Hauchecorne, 2010-01-19 The use of infrasound to monitor the atmosphere has like infrasound itself gone largely unheard of through the years But it has many applications and it is about time that a book is being devoted to this fascinating subject Our own involvement with infrasound occurred as graduate students of Prof William Donn who had established an infrasound array at the Lamont Doherty Geological Observatory now the Lamont Doherty Earth Observatory of Columbia University It was a natural outgrowth of another major activity at Lamont using seismic waves to explore the Earth's interior Both the atmosphere and the solid Earth feature velocity seismic or acoustic gradients in the vertical which act to refract the respective waves The refraction in turn allows one to calculate the respective background

structure in these mediums indirectly exploring locations that are hard to observe otherwise Monitoring these signals also allows one to discover various phenomena both natural and man made some of which have military applications
