Computer control of flexible manufacturing systems S. Joshi,J.S. Smith,2012-12-06 With the approach of the 21st century and the current trends in manufacturing the role of computer controlled flexible manufacturing an integral part in the success of manufacturing enterprises will take Manufacturing environments are changing to small batch with batch sizes diminishing to a quantity of one larger product variety production on demand with low lead times with the ability to be agile This is in stark contrast to conventional manufacturing which has relied on economies of scale and where change is viewed as a disruption and is

therefore detrimental to production Computer integrated manufacturing CIM and flexible manufacturing practices are a key component in the transition from conventional manufacturing to the new manufacturing environment While the use of computers in manufacturing from controlling individual machines NC Robots AGVs etc to controlling flexible manufacturing systems FMS has advanced the flexibility of manufacturing environments it is still far from reaching its full potential in the environment of the future Great strides have been made in individual technologies and control of FMS has been the subject of considerable research but computerized shop floor control is not nearly as flexible or integrated as hyped in industrial and academic literature In fact the integrated systems have lagged far behind what could be achieved with existing technology

**Through Optimization of Aerospace Vehicle Trajectories by the Pontryagin Maximum Principle** Alexander S. Filatyev, Vyacheslav G. Petukhov, 2025-05-28 This monograph investigates the trajectory optimization problems of low and finite thrust aerospace vehicles and spacecraft using an indirect method based on the Pontryagin maximum principle providing a methodological basis for the construction of numerical techniques that are superior in versatility and accuracy to direct methods This book provides a theoretical explanation of the approaches used and also an extensive gallery of the results of practical numerical studies The problem of boundary value problem convergence has been largely overcome which has made it possible to practically automate the optimization of trajectories and to achieve a qualitative generalization with a number of fundamentally new results Examples of practical optimization of branching trajectories of complex dynamics systems with finite and continual sets of branches in deterministic and stochastic statements with control constraints and phase constraints of various orders are demonstrated An emphasis is placed on the consistent application of methods of numerical continuation with respect to a parameter to solve various problems in the flight mechanics of spacecraft with an electric propulsion system EPS The problems considered include the optimization of direct interplanetary flights of spacecraft with thrusters having limited power or limited thrust of interplanetary flights of such spacecraft using gravity assisted maneuvers of multi orbit interorbital transfers of spacecraft with limited thrust EPS As a result it was possible to develop a set of numerical continuation methods for solving a wide range of optimization problems for spacecraft trajectories with EPS with improved characteristics in terms of convergence and performance This monograph also contains a description of many pitfalls in solving a wide range of problems of optimizing the trajectories of aerospace vehicles and recipes for effectively overcoming them
