Clathrochelates Y.Z. Voloshin, N.A. Kostromina, R.K. Krämer, 2002-09-19 Clathrochelates are compounds which contain a metal ion encapsulated within a three dimensional cage of macrobicyclic ligand atoms Within this cage the metal has unique properties and is to a great extent isolated from environmental factors Such complexes are suitable as models of the most essential biological systems membrane transport electron carriers highly selective and sensitive analytical reagents catalysts for photochemical and redox processes cation and anion receptors etc The aim of this monograph is to generalize and analyze experimental and theoretical data on clathrochelates in order to promote further research in this promising field of chemistry Chapter 1 gives general concepts of complexes with encapsulated metal ions discusses basic specific features of these compounds considers and characterizes the main types of compounds with encapsulated metal ions and the main classes of clathrochelates and includes the current nomenclature Chapter 2 deals with the pathways of clathrochelate synthesis and the general procedures for the synthesis of macrobicyclic tris dioximates phosphorus containing tris diiminates sepulchrates sarcophagines and polyene and other

types of clathrochelate complexes Chapter 3 concerns studies of the electronic and spatial structure of clathrochelate complexes In Chapter 4 the kinetics and mechanism of synthesis and decomposition reactions of macrobicyclic tris dioximates sarcophaginatates and sepulchrates in solution and gas phases are discussed Chapter 5 considers the electrochemical photochemical and some other characteristics of clathrochelates and their applications associated with these characteristics Finally the practical applications of the unique properties of clathrochelates and perspectives on the synthesis of new clathrochelates are described in Chapters 6 and 7 respectively
