Macromolecular Crystallography With Synchrotron Radiation:

Macromolecular Crystallography with Synchrotron Radiation John R. Helliwell, 1992 This highly illustrated monograph provides a comprehensive treatment of the study of the structure and function of the molecules of life proteins nucleic acids and viruses using synchrotron radiation and crystallography Beginning with chapters on the fundamentals of macromolecular crystallography and macromolecular structure the book goes on to review the sources and properties of synchrotron radiation instrumentation and monochromatic data collection There are also chapters on the Laue method on diffuse X ray scattering and on variable wavelength anomalous dispersion methods The book concludes with a description and survey of applications including studies at high resolution the use of small crystals the study of large unit cells and time resolved crystallography particularly of enzymes Appendices are provided that present essential information for the synchrotron user as well as information about synchrotron facilities currently available **Macromolecular**

Crystallography is one of the most multidisciplinary sciences with roots in fields as varied as mathematics physics chemistry biology materials science computation and earth and planetary science The structural knowledge gained from crystallography has been instrumental in acquiring new levels of understanding in numerous scientific areas P

International Tables for Crystallography, Volume F Eddy Arnold, Daniel M. Himmel, Michael G.

Rossmann, 2012-03-05 International Tables for Crystallography Volume F is an expert guide to macromolecular crystallography for the structural biologist. It was commissioned by the International Union of Crystallography in recognition of the extraordinary contributions that knowledge of macromolecular structure has made and will make to the analysis of biological systems from enzyme catalysis to the workings of a whole cell. The volume covers all stages of a crystallographic analysis from the preparation of recombinant proteins through crystallization, diffraction data collection, phase determination, structure validation and structure analysis. Although the volume is written for experienced scientists, it is recognized that the reader is more likely to be a biologist interested in structure than a classical crystallographer interested in biology. Thus there are chapters on the fundamentals, history and current perspectives of macromolecular crystallography as well as on useful programs and databases such as the Protein Data Bank. Each chapter is written by one or more internationally recognized experts. This second edition features 19 new articles and many articles from the first edition have been revised. The new articles cover topics such as standard definitions for quality indicators, expression of membrane proteins, protein engineering, high throughput crystallography, radiation damage, merohedral twinning, low resolution ab initio phasing, robotic crystal loading, whole cell X-ray diffraction imaging and halogen interactions in biological crystal structures. There are also new articles on relevant software including software for electron microscopy. These enhancements will ensure that Volume F continues to be a key reference for macromolecular crystallographers and structural biologists. Urzhumtsev, Vladimir Y. Lunin, 2013-04-03 This work presents a snapshot of the state of the art of modern biomolecular crystallography from crystallisation through structure determination and even interactive presentation on the web. Methods driving the latest automated structure determination pipelines are explained as well as how to deal with problems such as crystal pathologies that still demand expert analysis. These methods are illustrated through their application to problems of great biological interest such as the molecular machinery underlying the complement pathway, the mechanism of action of monoamine oxidase inhibitors and the structure of the eukaryotic ribosome. Complementary approaches such as neutron diffraction, small angle X-ray scattering, coherent diffraction and computational modelling are also explored. **Crystallography of Protein Dynamics**, 2023-09-25 Approx 400 pages.
