Advances in Cryptology G.R. Blakely, D. Chaum, 2003-05-16 Recently there has been a lot of interest in provably good pseudo random number generators [14, 31]. These cryptographically secure generators are good in the sense that they pass all probabilistic polynomial time statistical tests. However despite these nice properties the secure generators known so far suffer from the handicap of being inefficient: the most efficient of these take n^2 steps (one modular multiplication n being the length of the seed) to generate one bit. Pseudo random number generators that are currently used in practice output n bits per multiplication n^2 steps. An important open problem was to output even two bits on each multiplication in a cryptographically secure way. This problem was stated by Blum, Blum, Shub [3] in the context of their $z^2 \bmod N$ generator. They further ask how many bits can be output per multiplication maintaining cryptographic security. In this paper we state a simple condition, the XOR Condition, and show that any generator satisfying this condition can output $\log n$ bits on each multiplication. We show that the XOR Condition is satisfied by the ℓ least significant bits of the $z^2 \bmod N$ generator. The security of the $z^2 \bmod N$ generator was based on Quadratic Residuosity [3]. This generator is an example of a Trapdoor Generator [13] and its trapdoor properties have been used in protocol design. We strengthen the security of this generator by proving it as hard as
