

application is not only limited in processing capacity, with limited memory and also the problem of power real time and reliability. General with server superstructure resources and huge amount of memory. This system can only measure the remote signals and it cannot be used to control the process and also which is having limited capacity and lack in performing a real time operations. This system uses ARChitect embedded processor which is of very limited memory and processing speed also lacks to overcome this problem we gone for proposed system.

#### B. Proposed System

Because of the limited processing capacity, limited memory and the problem of power real time and reliability of DDC system has been overcome by the substitution of embedded Single Board for single chip method to realize interactive data acquisition and control (IDACN). This IDACN system can able to measure the remote signals and can control the remote devices through reliable protocols and communication network (TCP/IP).

Advancement in technology is very well reflected and supported by changes in measurement and control instrumentation. This system uses the Camera and Ultrasonic Sensor which are helps in monitoring the machine and its mean while the client can also see the live video while acquiring it on-line by using this video still they can have control and monitoring of the machine's. And also this system uses RTLinux Multi-tasking operating system to measure and control the whole process (fully pre-emptive). And the embedded with server side requires less resource usage, high reliability, security, consistency and portability.

## V. CONCLUSIONS

An advancement in technology is very well reflected and supported by changes in measurement and control instrumentation, with the rapid development of the field of industrial process control and the wide range of applications of network, intelligence, digital distributed control system, it is necessary to make a higher demand of the data accuracy and reliability of the control system. This embedded Single Board system can adapt to the new requirements of the data acquisition and control system such as the reliability, functionality, size, cost, power consumption, and remote access and so on. This system operated by DDCN made to acquire the signals and control the devices remotely. Embedded with server (Apache Tomcat) made to send the data with clients in real-time. Both machine are efficiently carried out by real time multi-tasking operating system (RTLinux-arch). This system can be widely applied to petroleum, electric power, chemical, metallurgy, steel, transportation, Electronic & Electrical industries,

Automobiles, Home security and so on. In the future implementation we can also interface the temperature sensor, and some system can also develop with GPRS.
