Atallah,Marina Blanton,2022-05-29 Algorithms and Theory of Computation Handbook Second Edition in a two volume set provides an up to date compendium of fundamental computer science topics and techniques It also illustrates how the topics and techniques come together to deliver efficient solutions to important practical problems New to the Second Edition Along with updating and revising many of the existing chapters this second edition contains more than 20 new chapters This edition now covers external memory parameterized self stabilizing and pricing algorithms as well as the theories of algorithmic coding privacy and anonymity databases computational games and communication networks It also discusses computational topology computational number theory natural language processing and grid computing and explores applications in intensity modulated radiation therapy voting DNA research systems biology and financial derivatives This best selling handbook continues to help computer professionals and engineers find significant information on various algorithmic topics The expert contributors clearly define the terminology present basic results and techniques and offer a number of current references to the in depth literature They also provide a glimpse of the major research issues concerning the relevant topics A Hybrid Deliberative Layer for Robotic Agents Ronny Hartanto,2011-07-18 The Hybrid Deliberative Layer HDL solves the problem that an intelligent agent faces in dealing with a large amount of information which may or may not be useful in generating a plan to achieve a goal The information that an agent may need is acquired and stored in the DL model Thus the HDL is used as the main knowledge base system for the agent In this work a novel approach which amalgamates Description Logic DL reasoning with Hierarchical Task Network HTN planning is introduced An analysis of the performance of the approach has been conducted and the results show that this approach yields significantly smaller planning problem descriptions than those generated by current representations in HTN planning Computational

Intelligence in Telecommunications Networks Witold Pedrycz, Athanasios Vasilakos, 2018-10-03 Telecommunications has evolved and grown at an explosive rate in recent years and will undoubtedly continue to do so As its functions applications and technology grow it becomes increasingly complex and difficult if not impossible to meet the demands of a global network using conventional computing technologies Computational intelligence CI is the technology of the future and the future is now Computational Intelligence in Telecommunications Networks offers an in depth look at the rapid progress of CI technology and shows its importance in solving the crucial problems of future telecommunications networks It covers a broad range of topics from Call Admission Control congestion control and QoS routing for ATM networks to network design and management optical mobile and active networks and Intelligent Mobile Agents Today s telecommunications professionals need a working knowledge of CI to exploit its potential to overcome emerging challenges The CI community must become acquainted with those challenges to take advantage of the enormous opportunities the telecommunications field offers This text meets both those needs clearly concisely and with a depth certain to inspire further theoretical and practical advances

**Plan-Based Control of Robotic Agents** Michael Beetz, 2003-07-01 Robotic agents such as autonomous office couriers or robot tourguides must be both reliable and efficient Thus they have to flexibly interleave their tasks exploit opportunities quickly plan their course of action and if necessary revise their intended activities This book makes three major contributions to improving the capabilities of robotic agents first a plan representation method is introduced which allows for specifying flexible and reliable behavior second probabilistic hybrid action models are presented as a realistic causal model for predicting the behavior generated by modern concurrent percept driven robot plans third the system XFRMLEARN capable of learning structured symbolic navigation plans is described in detail **Spatial and Temporal Reasoning** O.

Stock, 2007-07-27 Qualitative reasoning about space and time a reasoning at the human level promises to become a fundamental aspect of future systems that will accompany us in daily activity The aim of Spatial and Temporal Reasoning is to give a picture of current research in this area focusing on both representational and computational issues The picture emphasizes some major lines of development in this multifaceted constantly growing area The material in the book also shows some common ground and a novel combination of spatial and temporal aspects of qualitative reasoning Part I presents the overall scene The chapter by Laure Vieu is on the state of the art in spatial representation and reasoning and that by Alfonso Gerevini gives a similar survey on research in temporal reasoning The specific contributions to these areas are then grouped in the two main parts In Part II Roberto Casati and Achille Varzi examine the ontological status of spatial entities Anthony Cohn Brandon Bennett John Gooday and Nicholas Gotts present a detailed theory of reasoning with qualitative relations about regions Andrew Frank discusses the spatial needs of geographical information systems and Annette Herskovits focuses on the linguistic expression of spatial relations In Part III James Allen and George Ferguson describe an interval temporal logic for the representation of actions and events Drew McDermott presents an efficient way of predicting

the outcome of plan execution and Erik Sandewall introduces a semantics based on transitions for assessing theories of action and change In Part IV Antony Galton's chapter stands clearly between the two areas of space and time and outlines the main coordinates of an integrated approach

Handbook of Satisfiability Armin Biere, 2009 Satisfiability SAT related topics have attracted researchers from various disciplines logic applied areas such as planning scheduling operations research and combinatorial optimization but also theoretical issues on the theme of complexity and much more they all are connected through SAT My personal interest in SAT stems from actual solving The increase in power of modern SAT solvers over the past 15 years has been phenomenal It has become the key enabling technology in automated verification of both computer hardware and software Bounded Model Checking BMC of computer hardware is now probably the most widely used model checking technique The counterexamples that it finds are just satisfying instances of a Boolean formula obtained by unwinding to some fixed depth a sequential circuit and its specification in linear temporal logic Extending model checking to software verification is a much more difficult problem on the frontier of current research One promising approach for languages like C with finite word length integers is to use the same idea as in BMC but with a decision procedure for the theory of bit vectors instead of SAT All decision procedures for bit vectors that I am familiar with ultimately make use of a fast SAT solver to handle complex formulas Decision procedures for more complicated theories like linear real and integer arithmetic are also used in program verification Most of them use powerful SAT solvers in an essential way Clearly efficient SAT solving is a key technology for 21st century computer science I expect this collection of papers on all theoretical and practical aspects of SAT solving will be extremely useful to both students and researchers and will lead to many further advances in the field Edmund Clarke FORE Systems University Professor of Computer Science and Professor of Electrical and Computer Engineering at Carnegie Mellon University winner of the 2007 A M Turing Award

*Coordination of Large-Scale Multiagent Systems* Paul Scerri, Régis Vincent, Roger T. Mailler, 2006-03-14 Challenges arise when the size of a group of cooperating agents is scaled to hundreds or thousands of members In domains such as space exploration military and disaster response groups of this size or larger are required to achieve extremely complex distributed goals To effectively and efficiently achieve their goals members of a group need to cohesively follow a joint course of action while remaining flexible to unforeseen developments in the environment Coordination of Large Scale Multiagent Systems provides extensive coverage of the latest research and novel solutions being developed in the field It describes specific systems such as SERSE and WIZER as well as general approaches based on game theory optimization and other more theoretical frameworks It will be of interest to researchers in academia and industry as well as advanced level students

Intelligent Systems and Soft Computing Behnam Azvine, Nader Azarmi, Detlef D. Nauck, 2000-07-26 Artificial intelligence has traditionally focused on solving human centered problems like natural language processing or common sense reasoning On the other hand for a while now soft computing has been applied successfully in areas like pattern recognition clustering or automatic control The papers in this book explore the possibility of bringing these two areas together This book is unique in the way it concentrates on building intelligent software systems by combining methods from diverse disciplines such as fuzzy set theory neuroscience agent technology knowledge discovery and symbolic artificial intelligence The first part of the book focuses on foundational aspects and future directions the second part provides the reader with an overview of recently developed software tools for building flexible intelligent systems the final section studies developed applications in various fields

*Integration of Natural Language and Vision Processing* Paul Mc Kevitt, 2012-12-06 Although there has been much progress in developing theories models and systems in the areas of Natural Language Processing NLP and Vision Processing VP there has up to now been little progress on integrating these two subareas of Artificial Intelligence AI This book contains a set of edited papers on recent advances in the theories computational models and systems of the integration of NLP and VP

The volume includes original work of notable researchers Alex Waibel outlines multimodal interfaces including studies in speech gesture and points eye gaze lip motion and facial expression hand writing face recognition face tracking and sound localization in a connectionist framework Antony Cohen and John Gooday use spatial relations to describe visual languages Naoguki Okada considers intentions of agents in visual environments In addition to these studies the volume includes many recent advances from North America Europe and Asia demonstrating the fact that integration of Natural Language Processing and Vision is truly an international challenge
