Engineering Trustworthy Software Systems Jonathan P. Bowen,Zhiming Liu,Zili Zhang,2017-04-18 This volume contains a record of some of the lectures and seminars delivered at the Second International School on Engineering Trustworthy Software Systems SETSS 2016 held in March April 2016 at Southwest University in Chongqing China The six contributions included in this volume provide an overview of leading edge research in methods and tools for use in computer system engineering They have been distilled from six courses and two seminars on topics such as modelling and verification in event B parallel programming today runtime verification Java in the safety critical domain semantics of reactive systems parameterized unit testing formal reasoning about infinite data values and Alan Turing and his remarkable achievements The material is useful for postgraduate students researchers academics and industrial engineers who are interested in the theory and practice of methods and tools for the design and programming of trustworthy software systems *The Patentability of Software* Anton Hughes,2019-02-18 This book explores the question of whether software should be patented It analyses the ways in which the courts of the US the EU and Australia have attempted to deal with the problems surrounding the patentability of software and describes why it is that the software patent issue should be dealt with as a patentable subject matter issue rather than as an issue of novelty or nonobviousness Anton Hughes demonstrates that the current approach has failed and that a fresh approach to the software patent problem is needed The book goes on to argue against the patentability of software based on its close relationship to mathematics Drawing on historical and philosophical accounts of mathematics in pursuit of a better understanding of its nature and focusing the debate on the conditions necessary for mathematical advancement the author puts forward an analytical framework centred around the concept of the useful arts This analysis both explains mathematics and therefore software s nonpatentability and offers a theory of patentable subject matter consistent with Australian American and European patent law Software Engineering and Human-Computer Interaction Richard N. Taylor,Joelle Coutaz,1995-03-15 This volume presents the thoroughly revised proceedings of the ICSE 94 Workshop on Joint Research Issues in Software Engineering and Human Computer Interaction held in Sorrento Italy in May 1994 In harmony with the main objectives of the Workshop this book essentially contributes to establishing a sound common platform for exchange and cooperation among researchers and design professionals from the SE and HCI communities The book includes survey papers by leading experts as well as focused submitted papers Among the topics covered are design processes user interface technology and SE environments platform independence prototyping interactive behaviour CSCW and others *Maximizing Business Performance through Software Packages* Robert W. Security Compliance in Model-driven Development of Software Systems in Presence of Long-Term Evolution and Variants Sven Matthias Peldszus, 2022-07-13 For ensuring a software

system's security it is vital to keep up with changing security precautions attacks and mitigations Although model based development enables addressing security already at design time design models are often inconsistent with the implementation or among themselves An additional burden are variants of software systems To ensure security in this context we present an approach based on continuous automated change propagation allowing security experts to specify security requirements on the most suitable system representation We automatically check all system representations against these requirements and provide security preserving refactorings for preserving security compliance For both we show the application to variant rich software systems To support legacy systems we allow to reverse engineer variability aware UML models and semi automatically map existing design models to the implementation Besides evaluations of the individual contributions we demonstrate the approach in two open source case studies the iTrust electronics health records system and the Eclipse Secure Storage

Iterative Software Engineering for Multiagent Systems Jürgen Lind, 2003-06-29 The agent metaphor and the agent based approach to systems design constitute a promising new paradigm for building complex distributed systems However until now the majority of the agent based applications available have been built by researchers who specialize in agent based computing and distributed artificial intelligence If agent based computing is to become anything more than a niche technology practiced by the few then the base of people who can successfully apply the approach needs to be broadened dramatically A major step in this broadening endeavor is the development of methodologies for agent oriented software engineering accessible to and attractive for professional software engineers in their daily work Against this background this book presents one of the first coherent attempts to develop such a methodology for a broad class of agent based systems The author provides a clear introduction to the key issues in the field of agent oriented software engineering

Contagious Architecture Luciana Parisi, 2022-11-01 A proposal that algorithms are not simply instructions to be performed but thinking entities that construct digital spatio temporalities In Contagious Architecture Luciana Parisi offers a philosophical inquiry into the status of the algorithm in architectural and interaction design Her thesis is that algorithmic computation is not simply an abstract mathematical tool but constitutes a mode of thought in its own right in that its operation extends into forms of abstraction that lie beyond direct human cognition and control These include modes of infinity contingency and indeterminacy as well as incomputable quantities underlying the iterative process of algorithmic processing The main philosophical source for the project is Alfred North Whitehead whose process philosophy is specifically designed to provide a vocabulary for modes of thought exhibiting various degrees of autonomy from human agency even as they are mobilized by it Because algorithmic processing lies at the heart of the design practices now reshaping our world from the physical spaces of our built environment to the networked spaces of digital culture the nature of algorithmic

thought is a topic of pressing importance that reraises questions of control and ultimately power Contagious Architecture revisits cybernetic theories of control and information theory's notion of the incomputable in light of this rethinking of the role of algorithmic thought Informed by recent debates in political and cultural theory around the changing landscape of power it links the nature of abstraction to a new theory of power adequate to the complexities of the digital world **The Fate of AI Society** Kenneth James Hamer-Hodges, 2023-09-25 Hackers who exploit binary computers become expert cybercriminals A vicious cycle of undetected attacks by criminal gangs spies and foreign enemies fuels skilled staff shortages and escalating costs Ken Hamer Hodges explains why outdated computers cannot stop malware and how democracy is undermined by corrupt dictators Digital convergence subverts yesterday's binary computer allowing advanced malware pervasive cameras misinformation AI and deep fakes to destroy our culture and civilization His inspiring examples explain the perfection of computer science that all can grasp How malware thrives and why operating systems lead to Orwellian dictatorship To prevent catastrophe computer hardware must catch up with software progress preventing malware and stopping AI breakout He explains how to transition to a well engineered crime free global cybersociety How machine code achieves Alonzo Church's vision of networked function abstractions that avoid disaster by accelerating scientific progress Plotting the path for radical improvement is vital for civilization to flourish as democratically controlled AI empowered global cyber societies Ken shows how science drives high performance with high reliability for independent applications needed in a world run by superhuman software Join the author as he explores the fix to computer science He shows how nations can thrive in a world run by dubious software governed by superhuman AI working as functional democracies kept safe from criminals spies and dictators *Software Engineering* Roger S. Pressman, 2005 For more than 20 years this has been the best selling guide to software engineering for students and industry professionals alike This edition has been completely updated and contains hundreds of new references to software tools [Publications of the National Institute of Standards and Technology ... Catalog](#) National Institute of Standards and Technology (U.S.), National Institute of Standards and Technology (U.S.). Information Resources and Services Division, 1994 [A Brief History of Computing](#) Gerard O'Regan, 2008-02-01 Overview The objective of this book is to provide an introduction into some of the key topics in the history of computing The computing eld is a vast area and a truly comprehensive account of its history would require several volumes The aims of this book are more modest and its goals are to give the reader a flavour of some of the key topics and events in the history of computing It is hoped that this will stimulate the interested reader to study the more advanced books and articles available The history of computing has its origins in the dawn of civilization Early hunter gatherer societies needed to be able to perform elementary calculations such as counting and arithmetic As societies evolved into towns and communities there was a need for more sophisticated calculations This included primitive accounting to determine the appropriate taxation to be levied as well as the development of geometry to enable buildings templates and bridges to be

constructed Our account commences with the contributions of the Egyptians and Babylonians It moves on to the foundational work done by Boole and Babbage in the nineteenth century and to the important work on Boolean Logic and circuit design done by Claude Shannon in the 1930s The theoretical work done by Turing on computability is considered as well as work done by von Neumann and others on the fundamental architecture for computers **CASCON '94**, 1994
