Kirkpatrick, 2022-05-31 This text provides background information description and analysis of four major cooling system technologies vapor compression cooling evaporative cooling absorption cooling and gas cooling Vapor compression systems are currently the primary technology used in most standard domestic commercial and industrial cooling applications as they have both performance and economic advantages over the other competing cooling systems However there are many other applications in which evaporative cooling absorption cooling or gas cooling technologies are a preferred choice The main focus of the text is on the application of the thermal sciences to refrigeration and air conditioning systems The goals are to familiarize the reader with cooling technology nomenclature and provide insight into how refrigeration and air conditioning systems can be modeled and analyzed Cooling systems are inherently complex as the second law of thermodynamics does not allow thermal energy to be transferred directly from a lower temperature to a higher temperature so the heat transfer is done indirectly through a thermodynamic cycle Emphasis is placed on constructing idealized thermodynamic cycles to represent actual physical situations in cooling systems The text also contains numerous practical examples to show how one can calculate the performance of cooling system components By becoming familiar with the analyses presented in the examples one can gain a feel for the the representative values of the various thermal and mechanical parameters that characterize cooling systems
