Seeds J. Bewley, 2012-12-06 Since the publication of our monograph on seed physiology and biochemistry *The Physiology and Biochemistry of Seeds in Relation to Germination* Springer Verlag 1978 1982 it has been suggested to us that a text covering the same subject area would be appropriate This book is our response Unlike the previous volumes however this text is not intended to be either a critical or a comprehensive account Instead it is a more generalized consideration of the essential aspects of seed physiology and biochemistry as we see them It also includes a substantial amount of new and different material In a work of this sort it is inevitable that some simplifications must be made but we hope nevertheless that we have presented the most reasonable conspectus of areas of controversy and uncertainty In this respect literature citations have been kept to a minimum and do not interrupt the text they are placed at the end of each chapter and are intended to be used as a source for further references We hope that this book will be of value to students and teachers in universities colleges and other institutes of higher learning whose courses include plant biology Although it is particularly appropriate for studies of seed biology it should also find broader applications in general plant physiology agriculture and horticulture

**Breeding of Food Legumes** Aditya Pratap, Jitendra Kumar, 2011-03-01 Food legumes are important constituents of the human diet and animal feed where they are crucial to a balanced diet supplying high quality proteins. These crops also play an important role in low input agricultural production systems by fixing atmospheric nitrogen. Despite systematic and continuous breeding efforts through conventional methods, substantial genetic gains have not been achieved. With the rise in demand for food legumes, pulses, and increased market value of these crops, research has focused on increasing production and improving the quality of pulses for both edible and industrial use.

**Seed Biology and Yield of Grain Crops, 2nd Edition** Dennis B Egli, 2017-02-23 This new edition of an established title examines the determination of grain crop yield from a unique perspective by concentrating on the influence of the seed itself. As the food supply for an expanding world population is based on grain crops harvested for their seeds, understanding the process of seed growth and its regulation is crucial to our efforts to increase production and meet the needs of that population. Yield of grain crops is determined by their assimilatory processes such as photosynthesis and the biosynthetic processes in the seed, which are partly regulated within the seed itself. Substantially updated with new research and further developments of the practical applications of the concepts explored, this book is essential reading for those concerned with seed science and crop yield, including agronomists, crop physiologists, plant breeders, and extension workers. It is also a valuable source of information for lecturers and graduate students of agronomy and plant physiology.

**Seeds Handbook** Babasaheb B. Desai, 2004-04-22 Revised and expanded throughout, this latest edition of the bestselling *Seeds Handbook: Biology, Production, Processing, and Storage* includes valuable information on all areas of seed biology, production, and processing. The author, one of the most respected and prolific scientists in the field, identifies current developments in seed testing and certification, storage, transportation, and distribution. Tracking the evolution and advancement of seed industries and technologies, he fully covers the development and supply of high quality seeds for every key agronomic and horticulture crop. Contains methods to enhance the genetic and physiological characteristics of more than 80 major and minor crops. With an abundance of current research and additional figures and illustrations, this edition of the *Seeds Handbook* offers chapters on modern biotechnological issues such as the production of synthetic seeds, loss reduction, biotechnologies, and new strategies in the seed production industry. It provides in-depth information on burgeoning areas of seed science, including tissue culture and cellular totipotency induction and regeneration, protocols, development, and maturation, hormone requirements, drying, and storage of somatic embryos, protective encapsulation, and crop applications. With an eye to the future, it looks at challenges in the provision and enhancement of seeds for crop plants, practical methods of seed production and micropropagation, genetically modified seeds, and world food security.
