Continental Rifts: Evolution, Structure, Tectonics K.H. Olsen, 1995-11-24 This multi author book has been prepared by an international group of geoscientists that have been active in rift research since the late 1960s In 1984 an informal grass roots study group was initiated to compare individual research results and to explore in greater depth the apparent differences and similarities in the interpretations from various rift systems The group became known as the CREST working group an acronym of Continental Rifts Evolution Structure and Tectonics which not surprisingly became the title of this book Continental Rifts Evolution Structure Tectonics presents an overview of the present state of understanding and knowledge of the processes of continental rifting from a multidisciplinary lithospheric scale perspective The chapters have been structured on each rift system in approximately the same synoptic sequence so as to facilitate comparisons of rifts by the reader The book complements its predecessors by presenting a more unified picture It succeeds in presenting the status of a representative majority of the continental rift systems that have been at the forefront of recent research For students and experienced researchers alike this book will be of significant value in assessing the current state of knowledge and in serving as a framework for future research

Earthquake Research and Analysis Sebastiano D'Amico, 2012-02-08 This book is devoted to different aspects of earthquake research Depending on their magnitude and the placement of the hypocenter earthquakes have the potential to be very destructive Given that they can cause significant losses and deaths it is really important to understand the process and the physics of this phenomenon This book does not focus on a unique problem in earthquake processes but spans studies on historical earthquakes and seismology in different tectonic environments to more applied studies on earthquake geology

The Afar Volcanic Province Within the East African Rift System G. Yirgu, Cindy J. Ebinger, P. K. H. Maguire, 2006 The seismically and volcanically active East African Rift System is an ideal laboratory for continental break up processes it encompasses all stages of rift development Its northernmost sectors within the Afar volcanic province include failed rifts nascent sea floor spreading and youthful passive continental margins associated with one or more mantle plumes A number of models have been proposed to explain the success and failure of continental rift zones but there remains no consensus on how strain localizes to achieve rupture of initially 125 250 km thick plates or on the interaction between the plates and asthenospheric processes This collection of papers provides new structural stratigraphic geochemical and geophysical data and numerical models needed to resolve fundamental questions concerning continental break up and mantle plume processes The focus is on how mantle melt intrudes and is distributed through the plate and how this magma intrusion process controls along axis segmentation and facilitates break up

Recent Evolution and Seismicity of the Mediterranean Region E. Boschi, E. Mantovani, A. Morelli, 2012-12-06 The Mediterranean is one of the most studied regions of the world In spite of this a considerable spread of opinions exists about the geodynamic evolution and the present tectonic setting of this zone The difficulty in recognizing the driving mechanisms of deformation is due to a large extent to the complex distribution in space and time of tectonic events to the high number of parameters involved in this problem and to the scarce possibility of carrying out quantitative estimates of the deformation implied by the various geodynamic hypotheses However we think that a great deal of the present ambiguity could be removed if there were more frequent and open discussions among the scientists who are working on this problem The meeting of ERICE was organized to provide an opportunity in this sense In making this effort we were prompted by the conviction that each step towards the understanding of the Mediterranean evolution is of basic importance

both for its scientific consequences and for the possible implications for society. It is well known for instance that the knowledge of ongoing tectonic processes in a given region and of their connection with seismic activity may lead to the recognition of middle long term precursors of strong earthquakes. The few cases of tentative earthquake prediction in the world occurred where information on large scale seismo-tectonic behavior was available. This led to identify the zones prone to dangerous shocks where observations of short term earthquake precursors were then concentrated.

Subduction Zone Geodynamics Serge Lallemant, Francesca Funiciello, 2009-02-11 Subduction is a major process that plays a first order role in the dynamics of the Earth. The sinking of cold lithosphere into the mantle is thought by many authors to be the most important source of energy for plates driving forces. It also deeply modifies the thermal and chemical structure of the mantle producing arc volcanism and is responsible for the release of most of the seismic energy on Earth. There has been considerable achievements done during the past decades regarding the complex interactions between the various processes acting in subduction zones. This volume contains a collection of contributions that were presented in June 2007 in Montpellier France during a conference that gave a state of the art panorama and discussed the perspectives about Subduction Zone Geodynamics. The papers included in this special volume offer a unique multidisciplinary picture of the recent research on subduction zones geodynamics. They are organized into five main topics: Subduction zone geodynamics, Seismic tomography and anisotropy, Great subduction zone earthquakes, Seismogenic zone characterization, Continental and ridge subduction processes. Each of the 13 papers collected in the present volume is primarily concerned with one of these topics. However it is important to highlight that papers always treat more than one topic so that all are related lighting on different aspects of the complex and fascinating subduction zones geodynamics.

New Publications of the U.S. Geological Survey, 1994 *New Publications of the U.S. Geological Survey* Geological Survey (U.S.), 1994 *Tectonic and Stratigraphic Evolution of Zagros and Makran During the Mesozoic-Cenozoic* Pascale Leturmy, Cécile Robin, 2010 The Zagros fold thrust belt (ZFTB) extends from Turkey to the Hormuz Strait resulting from the collision of the Arabian and Eurasian plates during Cenozoic times and separates the Arabian platform from the large plateaux of central Iran. To the east a pronounced syntax marks the transition between the Zagros collision belt and the Makran accretionary wedge. In the ZFTB the Proterozoic to Recent stratigraphic succession pile is involved in huge folds and offers the opportunity to study the stratigraphic and tectonic evolution of the Palaeo-Tethyan margin. Few recent data were widely available on the southern Tethys margin preserved in the Zagros Mountains. The Middle East Basins Evolution (MEBE) program was an excellent opportunity to go back to the field and to collect new data to better constrain the evolution of this margin. In this volume the structure of the Zagros Mountains is explored through different scales and using different methodologies.

New areas of discussion include extinctions, origins of

life plate tectonics and its influence on faunal provinces new types of mineral and hydrocarbon deposits new methods of dating rocks and geological processes Users will find this to be a fundamental resource for teachers and students of geology as well as researchers and non geology professionals seeking up to date reviews of geologic research Provides a comprehensive and accessible one stop shop for information on the subject of geology explaining methodologies and technical jargon used in the field Highlights connections between geology and other physical and biological sciences tackling research problems that span multiple fields Fills a critical gap of information in a field that has seen significant progress in past years Presents an ideal reference for a wide range of scientists in earth and environmental areas of study

Approaches to Scaling of Trace Gas Fluxes in Ecosystems A.F. Bouwman, 1999-02-23 This excellent book covers techniques used for extrapolating measurements of trace gas fluxes and factors regulating the production consumption and exchange of trace gases in terrestrial and aquatic environments It provides a comprehensive summary of all aspects of scaling from flux measurement techniques geographic data modelling use of tracers and isotopes inverse modelling and satellite borne atmospheric observations An interesting feature of the book is the fact that both fluxes from terrestrial and aquatic marine sources are discussed along with the uncertainties in estimates of trace gas fluxes at different scales including point field landscape regional and global scale As well as reviewing the state of the art in the field of scaling of fluxes of greenhouse gases ozone and aerosol and their precursors and acidifying compounds the emphasis of this volume is on identification of gaps in knowledge finding solutions and determination of future research directions

Seismology and Structure of the Earth Barbara Romanowicz, Adam Dziewonski, 2010-04-20 Treatise on Geophysics Seismology and Structure of the Earth Volume 1 provides a comprehensive review of the state of knowledge on the Earth's structure and earthquakes It addresses various aspects of structural seismology and its applications to other fields of Earth sciences The book is organized into four parts The first part principally covers theoretical developments and seismic data analysis techniques from the end of the nineteenth century until the present with the main emphasis on the development of instrumentation and its deployment The second part reviews the status of knowledge on the structure of the Earth's shallow layers starting with a global review of the Earth's crustal structure The third part focuses on the Earth's deep structure divided into its main units the upper mantle the transition zone and upper mantle discontinuities the D region at the base of the mantle and the Earth's core The fourth part comprises two chapters which discuss constraints on Earth structure from fields other than seismology mineral physics and geodynamics Self contained volume starts with an overview of the subject then explores each topic with in depth detail Extensive reference lists and cross references with other volumes to facilitate further research Full color figures and tables support the text and aid in understanding Content suited for both the expert and non expert

Microseismic Monitoring Vladimir Grechka, Werner M. Heigl, 2017-09-01 Over the past decade microseismic monitoring a technology developed for evaluating completions of wells drilled to produce hydrocarbons from

unconventional reservoirs has grown increasingly popular among oil and gas companies. *Microseismic Monitoring* by Vladimir Grechka and Werner M Heigl discusses how to process microseismic data, what can and cannot be inferred from such data, and to what level of certainty this might be possible. The narrative of the book follows the passage of seismic waves from a source triggered by hydraulic fracture stimulation through hydrocarbon bearing formations towards motion sensors. The waves' characteristics encode the location of their source and its focal mechanism. The analysis of various approaches to harvesting the source-related information from microseismic records has singled out the accuracy of the velocity model, fully accounting for the strong elastic anisotropy of hydraulically fractured shales, as the most critical ingredient for obtaining precise source locations and interpretable moment tensors. The ray theory, complemented by its modern extensions, paraxial and Fréchet ray tracing, provides the only practical means available today for building such models. The book is written for geophysicists interested in learning and applying advanced microseismic data processing techniques.
