Security in Pervasive Computing Dieter Hutter, 2004-01-26 This book constitutes the thoroughly refereed post proceedings of the First International Conference on Security in Pervasive Computing held in Boppard Germany in March 2003 The 19 revised full papers presented together with abstracts of 4 invited talks and a workshop summary were carefully selected during two rounds of reviewing and improvements The papers are organized in topical sections on location privacy security requirements security policies and protection authentication and trust secure infrastructures smart labels verifications and hardware architectures *Security in Pervasive Computing* Dieter Hutter, Gunter Muller, Werner Stephan, 2014-01-15 **Privacy, Security and Trust within the Context of Pervasive Computing** Philip Robinson, Harald Vogt, Waleed Wagealla, 2006-06-07 Privacy Security and Trust within the Context of Pervasive Computing is an edited volume based on a post workshop at the second international conference on Pervasive Computing The workshop was held April 18-23 2004 in Vienna Austria The goal of the workshop was not to focus on specific even novel mechanisms but rather on the interfaces between mechanisms in different technical and social problem spaces An investigation of the interfaces between the notions of context privacy security and trust will result in a deeper understanding of the atomic problems leading to a more complete understanding of the social and technical issues in pervasive computing [Security in Pervasive Computing](#) John A. mechanisms that utilize security and privacy methods when handling context. Pervasive applications can then use these mechanisms and create pervasive environments while preserving the user's privacy. Here we show how context information can be processed and queried in a privacy preserving manner. By securing the authenticity and integrity of context information and creating a secure context distribution algorithm, we show how pervasive applications can use and share context securely. Second, we introduce secure role assignment as a mechanism for environment adaptation which is built on context information. Similar to context roles, they need to be protected and secured during distribution. Additionally, we add system support for secure roles which can be used for role based access control by pervasive applications. Third, we create a secure key exchange mechanism that can be used to secure the communication between users and devices. This is an essential step that needs to be performed before any private information can be shared among them. Fourth, we introduce a framework for the automatic generation of a privacy policy. This framework creates an individual privacy policy that can be used to share context between users, devices, or applications while preserving the user's will with regard to context privacy.

Privacy in Mobile and Pervasive Computing Marc Langheinrich, Florian Schaub, 2022-05-31

It is easy to imagine that a future populated with an ever increasing number of mobile and pervasive devices that record our minute goings and doings will significantly expand the amount of information that will be collected, stored, processed, and shared about us by both corporations and governments. The vast majority of this data is likely to benefit us greatly, making our lives more convenient, efficient, and safer through custom tailored and context aware services that anticipate what we need, where we need it, and when we need it. But beneath all this convenience, efficiency, and safety lurks the risk of losing control and awareness of what is known about us in the many different contexts of our lives. Eventually, we may find ourselves in a situation where something we said or did will be misinterpreted and held against us, even if the activities were perfectly innocuous at the time. Even more concerning, privacy implications rarely manifest as an explicit, tangible harm. Instead, most privacy harms manifest as an absence of opportunity, which may go unnoticed even though it may substantially impact our lives.

In this Synthesis Lecture, we dissect and discuss the privacy implications of mobile and pervasive computing technology. For this purpose, we not only look at how mobile and pervasive computing technology affects our expectations of, and ability to enjoy, privacy, but also look at what constitutes privacy in the first place and why we should care about maintaining it. We describe key characteristics of mobile and pervasive computing technology and how those characteristics lead to privacy implications. We discuss seven approaches that can help support end user privacy in the design of mobile and pervasive computing technologies and set forward six challenges that will need to be addressed by future research. The prime target audience of this lecture are researchers and practitioners working in mobile and pervasive computing who want to better understand and account for the nuanced privacy implications of the technologies they are creating. Those new to either mobile and pervasive computing or privacy may also benefit from reading this book to gain an overview and deeper understanding of this highly interdisciplinary

These physical methods use system based controls to verify the identity of a person or process explicitly enabling or restricting the ability to use change or view a computer resource However these strategies are inadequate for the increased flexibility that distributed networks such as the Internet and ubiquitous pervasive computing environments require as these systems lack central control and in addition their users are not all predetermined Users in pervasive environments expect to access locally hosted resources and services anytime and anywhere leading to serious security risks and access control problems We propose a solution based on distributed trust management which involves developing a security policy assigning credentials to entities verifying that the credentials conform to the policy delegating trust to third parties revoking rights and reasoning about users access rights This paper presents an infrastructure that complements existing security features like Public Key Infrastructure PKI and Role Based Access Control with distributed trust management to provide a highly flexible mode of enforcing security in pervasive computing environments
