Horobin, 2014-05-16 Histochemistry An Explanatory Outline of Histochemistry and Biophysical Staining describes

the histochemical staining of cells and tissues as a major tool applied in biological and medical investigations both in basic research and in practical applications such as clinical diagnosis The book may be considered as a guide to understanding the scientific basis of staining procedures and alternate actions to take when common methods do not proceed as expected The first chapter gives general theoretical ideas from which most part of the book is largely organized around As the book considers the arts and crafts making up the practice of histochemistry and biological staining emphasis is given to the common physicochemical aspects of the technically diverse methodologies involved Hence the author has drawn ideas and information from physicochemically and biochemically related fields such as chromatography pharmacology photography tanning and textile dyeing The bulk of the book is structured around groups of practical procedures such as fixation staining with dyestuffs metal impregnation and selective extraction as a test of significance Lastly general essays on the usefulness of staining theories and on the problems arising from reagent impurities are given as examples The text is suitable for students and researchers in the fields of physiology biochemistry and pharmacology Clinical laboratory scientists and those involved in the life sciences and biotechnology will benefit from reading the book

Regulation

of Hepatic Metabolism K. Jungermann, F.C. Kauffman, R.G. Thurman, 2012-12-06 The liver is an exceptionally complex and diverse organ that functions both as an exocrine and an endocrine gland It secretes bile which contains many constituents in addition to bile salts and it synthesizes and releases many substances in response to the body's demands including prohormones albumin clotting factors glucose fatty acids and various lipoproteins It has a dual blood supply providing a rich mixture of nutrients and other absorbed substances via the portal vein and oxygen rich blood via the hepatic artery This functional heterogeneity is accompanied by cellular heterogeneity The liver contains many cell types including hepatic parachymal cells Kiipffer cells Ito cells and endothelial cells The most abundant cell type the parenchymal cells are biochemically and structurally heterogeneous The cells in the oxygen rich areas of the portal triad appear more dependent on oxidative metabolism whereas those around the central vein pericentral perivenous or centrolobular areas are more dependent upon an anaerobic mechanism Throughout this volume the latter three terms are used synonymously by various authors to indicate the five to eight layers of cells radiating from the central vein Structural and metabolic heterogeneity of hepatic parenchymal cells has been demonstrated by a variety of approaches including histochemical ultra structural and ultramicrobiochemical studies This microheterogeneity is linked to the physiological functions of the liver and its response to injurious substances
