

Introduction to Economic Growth

Development of Modern Growth Theory

Questions -

1. Why are some people (countries) rich and some poor?
Need to find determinants of GDP and growth rates to answer this
2. Why do some countries grow faster than others?
3. In long-run, is growth rate exogenous or endogenous?

Endogenous Variable - Determined by decisions (usually based on optimizing behavior; e.g., maximize utility leads to demand; maximize profit leads to supply); (2) something you can change through policy (e.g., tax will change P_D , P_S , and Q)

Supply & Demand - $P_D = a - bQ$ and $P_S = c + dQ$; this leads to $P_D = P_S = a - bQ = c + dQ$
 $\Rightarrow Q = (a - c)/(d + b)$ $\therefore Q$ is given (endogenous)

Growth Rate - can policies affect growth rate (i.e., is growth rate endogenous)?
neoclassical theory says yes, but only in transition, not in long-run; some newer theories say yes; others say no

Technology - technical description; production function; intuitive: instructions for how to produce things

Rice Example - cooking rice requires a pot and heat source (capital), rice and water (resources), and a recipe with directions on how to cook it (technology)

Steady State Equilibrium - also called long-run equilibrium; all variables grow at a constant rates (could be different from each other, but constant over [or independent of] time)

Brief History -

Adam Smith - focused on accumulation of capital

Carl Marx - focused on technological change and unemployment

Ricardo - focused on class structure

Neoclassical Growth Theory - Solow (1956); assumptions:

- Perfect competition in all markets
- Exogenous rate of population growth (in long-run)
- Exogenous rate of technological change (in long-run)
- Endogenous income per capita levels
- Endogenous transitional growth rates

Example - look at income per capita (y); we can change the growth rate (dy/dt) in transition, but not in the long-run (i.e., slope stays the same)

New Growth Theory - Romer (1986) & Lucas (1988); also called **endogenous growth** theory because now long-run growth rate can change; dropped perfect competition assumption and made technical change endogenous

Schumpeterian Approach to Economic Growth - new products have short lifetimes (all companies from the original Dow Industrial list are gone except General Electric); firms enjoy temporary monopoly power (imperfect competition) then are replaced (creative destruction); all used fixed population (not realistic) because introducing any population growth means economic growth unlimited (also not realistic)

Grossman & Helpman (1991), Aghion & Howitt (1992), Segerstrom, et. al. (1990) - focused on product quality

Romer (1990) - focused on product variety

Rethinking Economic Growth Theory From a Biophysical Perspective Blair Fix, 2014-12-09 Neoclassical growth theory is the dominant perspective for explaining economic growth At its core are four implicit assumptions 1 economic output can become decoupled from energy consumption 2 economic distribution is unrelated to growth 3 large institutions are not important for growth and 4 labor force structure is not important for growth Drawing on a wide range of data from the economic history of the United States this book tests the validity of these assumptions and finds no empirical support Instead connections are found between the growth in energy consumption and such disparate phenomena as economic redistribution corporate employment concentration and changing labor force structure The

integration of energy into an economic growth model has the potential to offer insight into the future effects of fossil fuel depletion on key macroeconomic indicators which is already manifested in stalled or diminished growth and escalating debt in many national economies This book argues for an alternative biophysical perspective to the study of growth and presents a set of stylized facts that such an approach must successfully explain Aspects of biophysical analysis are combined with differential monetary analysis to arrive at a unique empirical methodology for investigating the elements and dependencies of the economic growth process

EU Competition Law and the Information and Communication Technology Network Industries Andrej Fatur, 2012-03-08 Competition policies have long been based on a scholarly tradition focused on static models and static analysis of industrial organisation However recent developments in industrial organisation literature have led to significant advances moving beyond traditional static models and a preoccupation with price competition to

consider the organisation of industries in a dynamic context This is especially important in the field of information and communication technology ICT network industries where competition centres on network effects innovation and intellectual property rights and where the key driver of consumer benefit is technological progress Consequently when an antitrust intervention is contemplated a number of considerations that arise out of the specific nature of the ICT sector have to be taken into account to ensure improved consumer welfare This book considers the adequacy of existing EU competition policy in the area of the ICT industries in the light of the findings of modern economic theory Particular attention is given to the implications of these dynamic markets for the competitive assessment and treatment of the most common competitive harms in this area such as non price predatory practices tying and bundling co operative standard setting platform joint ventures and co operative R D

Advanced Macroeconomics Filipe R. Campante, Federico Sturzenegger, Andrés Velasco, 2021-10-11 Macroeconomic policy is one of the most important policy domains and the tools of macroeconomics are among the most valuable for policy makers Yet there has been up to now a wide gulf between the level at which macroeconomics is taught at the undergraduate level and the level at which it is practiced At the same time doctoral level textbooks are usually not targeted at a policy audience making advanced macroeconomics less accessible to current and aspiring practitioners This book born out of the Masters course the authors taught for many years at the Harvard Kennedy School fills this gap It introduces the tools of dynamic optimization in the context of economic growth and then applies them to a wide range of policy questions ranging from pensions consumption investment and finance to the most recent developments in fiscal and monetary policy It does so with the requisite rigor but also with a light touch and an unyielding focus on their application to policy making as befits the authors own practical experience *Advanced Macroeconomics An Easy Guide* is bound to become a great resource for graduate and advanced undergraduate students and practitioners alike
