Battin, 1956 **Statistics of Random Processes I** R.S. Liptser, A.N. Shiryaev, 2013-11-11 A considerable number of problems in the statistics of random processes are formulated within the following scheme On a certain probability space Q a partially observable random process $\{x_t\}_{t \geq 0}$ is given with only the second component n_t observed At any time t it is required based on h_t to estimate the unobservable state x_t This problem of estimating in other words the filtering problem will be discussed in this book It is well known that if M_t

Models of Random Processes Igor N. Kovalenko, Nickolaj Yu. Kuznetsov, Valentin M. Shurenkov, 1996-07-08 Devising and investigating random processes that describe mathematical models of phenomena is a major aspect of probability theory applications Stochastic methods have penetrated into an unimaginably wide scope of problems encountered by researchers who need stochastic methods to solve problems and further their studies This handbook supplies the knowledge you need on the modern theory of random processes Packed with methods Models of Random Processes A Handbook for Mathematicians and Engineers presents definitions and properties on such widespread processes as Poisson Markov semi Markov Gaussian and branching processes and on special processes such as cluster self exiting double stochastic Poisson Gauss Poisson and extremal processes occurring in a variety of different practical problems The handbook is based on an axiomatic definition of probability space with strict definitions and constructions of random processes Emphasis is placed on the constructive definition of each class of random processes so that a process is explicitly defined by a sequence of independent random variables and can easily be implemented into the modelling Models of Random Processes A Handbook for Mathematicians and Engineers will be useful to researchers engineers postgraduate students and teachers in the fields of mathematics physics engineering operations research system analysis econometrics and many others **Optimal Control Systems by AA Fel'Dbaum** , 1966-01-01 In this book we study theoretical and practical aspects of computing methods for mathematical modelling of nonlinear systems A number of computing techniques are considered such as methods of operator approximation with any given accuracy operator interpolation techniques including a non Lagrange interpolation methods of system representation subject to constraints associated with concepts of causality memory and stationarity methods of system representation with an accuracy that is the best within a given class of models methods of covariance matrix estimation methods for low rank matrix approximations hybrid methods based on a combination of iterative procedures and best operator approximation and methods for information compression and filtering under condition that a filter model should

satisfy restrictions associated with causality and different types of memory As a result the book represents a blend of new methods in general computational analysis and specific but also generic techniques for study of systems theory and its particular branches such as optimal filtering and information compression Best operator approximation Non Lagrange interpolation Generic Karhunen Loeve transform Generalised low rank matrix approximation Optimal data compression Optimal nonlinear filtering *Digital Simulation of a Gaussian Random Process Having an Exponential Autocorrelation Function* D. K. Bowser, G. R. Schubert, 1967 The digital simulation of terrain or longitudinal gust profiles is shown to be practical Its use as input to an overall system simulation has reasonable promise of success With the tools developed in this report the user has at his disposal a means of determining what is a reasonable choice for the numerical integration increment and what is a sufficient sample length in a statistical sense
