Recent Advances In Combustion Modelling:

Recent Advances In Combustion Modelling John Buckmaster, Sebastien Candel, C Kennel, B Larrouturou, N Peters, Forman A Williams, 1990-11-20 This volume gathers the contributions of six world experts to a course on combustion modelling. Therefore a pedagogical effort has been made in writing up these texts which cover state of the art advances in most aspects of combustion science. The book is aimed at students, researchers and engineers as was the course. *Recent Advances In Spray Combustion* Kenneth K. Kuo, 1996. *Recent Advances in DNS and LES* Doyle Knight, Leonidas Sakell, 2012-12-06. Rapid advances in Direct Numerical Simulation (DNS) and Large Eddy Simulation (LES) of turbulence provide opportunities for improved prediction of incompressible and compressible turbulent flows. The book includes five invited and thirty-eight contributed papers presented at the Second AFOSR International Conference on DNS and LES held at Rutgers The State University of New Jersey on June 7-9, 1999. A broad range of topics in DNS and LES are presented including new developments in LES modeling, numerical algorithms for LES and DNS, DNS and LES of reacting flows and DNS and LES for supersonic and hypersonic boundary layers. The book provides an extensive view of the state of the art in DNS and LES.

Recent Advances In Elasticity, Viscoelasticity And Inelasticity Kumbakonam R Rajagopal, 1995-02-20 This is a collection of papers dedicated to Prof T C Woo to mark his 70th birthday. The papers focus on recent advances in elasticity, viscoelasticity and inelasticity which are related to Prof Woo's work. Prof Woo's recent work concentrates on the viscoelastic and viscoplastic response of metals and plastics when thermal effects are significant and the papers here address open questions in these and related areas. **Turbulent Combustion Modeling** Tarek Echekki, Epaminondas

Mastorakos, 2010-12-25. Turbulent combustion sits at the interface of two important nonlinear multiscale phenomena: chemistry and turbulence. Its study is extremely timely in view of the need to develop new combustion technologies in order to address challenges associated with climate change, energy source uncertainty and air pollution. Despite the fact that modeling of turbulent combustion is a subject that has been researched for a number of years, its complexity implies that key issues are still eluding and a theoretical description that is accurate enough to make turbulent combustion models rigorous and quantitative for industrial use is still lacking. In this book, prominent experts review most of the available approaches in modeling turbulent combustion with particular focus on the exploding increase in computational resources that has allowed the simulation of increasingly detailed phenomena. The relevant algorithms are presented, the theoretical methods are explained and various application examples are given. The book is intended for a relatively broad audience including seasoned researchers and graduate students in engineering, applied mathematics and computational science, engine designers and computational fluid dynamics (CFD) practitioners, scientists at funding agencies and anyone wishing to understand the state of the art and the future directions of this scientifically challenging and practically important field.
