Recent Developments In Cooperative Control And Optimization:

Recent Developments in Cooperative Control and Optimization Sergiy Butenko, Robert Murphey, Panos M. Pardalos, 2004

Over the past several years cooperative control and optimization has unquestionably been established as one of the most important areas of research in the military sciences. Even so, cooperative control and optimization transcends the military in its scope, having become quite relevant to a broad class of systems with many exciting commercial applications. One reason for all the excitement is that research has been so incredibly diverse, spanning many scientific and engineering disciplines. This latest volume in the Cooperative Systems book series clearly illustrates this trend towards diversity and creative thought. And no wonder: cooperative systems are among the hardest systems control science has endeavored to study; hence, creative approaches to modeling, analysis, and synthesis are a must. The definition of cooperation itself is a slippery issue. As you will see in this and previous volumes, cooperation has been cast into many different roles and therefore has assumed many diverse meanings. Perhaps the most we can say, which unites these disparate concepts, is that cooperation 1) requires more than one entity, 2) the entities must have some dynamic behavior that influences the decision space, 3) the entities share at least one common objective, and 4) entities are able to share information about themselves and their environment.

Optimization and control have long been active fields of research in engineering. **Optimization and Logistics**

Challenges in the Enterprise Wanpracha Chaovalitwongse, Kevin C. Furman, Panos M. Pardalos, 2009-06-17 In a world with highly competitive markets and economic instability due to capitalization, industrial competition has increasingly intensified. In order for many industries to survive and succeed, they need to develop highly effective coordination between supply chain partners, dynamic collaborative and strategic alliance relationships, and efficient logistics and supply chain network designs. Consequently, in the past decade, there has been an explosion of interest among academic researchers and industrial practitioners in innovative supply chain and logistics models, algorithms, and coordination policies. Mathematically distinct from classical supply chain management, this emerging research area has been proven to be useful and applicable to a wide variety of industries. This book brings together recent advances in supply chain and logistics research and computational optimization that apply to a collaborative environment in the enterprise. Mathematical Aspects of Network Routing

Optimization Carlos A.S. Oliveira, Panos M. Pardalos, 2011-08-26 Before the appearance of broadband links and wireless systems, networks have been used to connect people in new ways. Now, the modern world is connected through large-scale computational networked systems such as the Internet. Because of the ever-advancing technology of networking, efficient algorithms have become increasingly necessary to solve some of the problems developing in this area. **Mathematical Aspects of Network Routing Optimization** focuses on computational issues arising from the process of optimizing network routes, such as quality of the resulting links and their reliability. Algorithms are a cornerstone for the understanding of the protocols underlying multicast routing. The main objective in the text is to derive efficient algorithms with or without guarantee of

Search and Classification Using Multiple Autonomous Vehicles Yue Wang, Islam I. Hussein, 2012-04-02 Search and Classification Using Multiple Autonomous Vehicles provides a comprehensive study of decision making strategies for domain search and object classification using multiple autonomous vehicles MAV under both deterministic and probabilistic frameworks It serves as a first discussion of the problem of effective resource allocation using MAV with sensing limitations i e for search and classification missions over large scale domains or when there are far more objects to be found and classified than there are autonomous vehicles available Under such scenarios search and classification compete for limited sensing resources This is because search requires vehicle mobility while classification restricts the vehicles to the vicinity of any objects found The authors develop decision making strategies to choose between these competing tasks and vehicle motion control laws to achieve the proposed management scheme Deterministic Lyapunov based probabilistic Bayesian based and risk based decision making strategies and sensor management schemes are created in sequence Modeling and analysis include rigorous mathematical proofs of the proposed theorems and the practical consideration of limited sensing resources and observation costs A survey of the well developed coverage control problem is also provided as a foundation of search algorithms within the overall decision making strategies Applications in both underwater sampling and space situational awareness are investigated in detail The control strategies proposed in each chapter are followed by illustrative simulation results and analysis Academic researchers and graduate students from aerospace robotics mechanical or electrical engineering backgrounds interested in multi agent coordination and control in detection and estimation or in Bayes filtration will find this text of interest
