Moving Target:

Optimal Search for Moving Targets Lawrence D. Stone, Johannes O. Royset, Alan R. Washburn, 2016-04-06 This book begins with a review of basic results in optimal search for a stationary target. It then develops the theory of optimal search for a moving target providing algorithms for computing optimal plans and examples of their use. Next it develops methods for computing optimal search plans involving multiple targets and multiple searchers with realistic operational constraints on search movement. These results assume that the target does not react to the search. In the final chapter there is a brief overview of mostly military problems where the target tries to avoid being found as well as rescue or rendezvous problems where the target and the searcher cooperate. Larry Stone wrote his definitive book *Theory of Optimal Search* in 1975 dealing almost exclusively with the stationary target search problem. Since then the theory has advanced to encompass search for targets that move even as the search proceeds and computers have developed sufficient capability to employ the improved theory. In this book Stone joins Royset and Washburn to document and explain this expanded theory of search. The problem of how to search for moving targets arises every day in military rescue, law enforcement and border patrol operations. **An**

Airborne Radar Technique for Moving-target Detection, Location, and Tracking John K. Schindler, 1973 A novel technique for detecting, locating and tracking moving targets from an airborne radar platform is described and analyzed. The technique uses the generally dissimilar linear doppler frequency modulated signals from moving targets and stationary ground clutter. A matched filter processor is defined and its resolution and ambiguity properties studied as function processor parameters. Sub clutter visibility of the processor is then determined. Two techniques for digitally implementing the processor are discussed and the computational efficiencies briefly analyzed. Finally target angular position can be determined using phase monopulse. It is then shown that target velocity, both ground speed and target heading, can be determined from radar observables. Author **Study on Ground Moving Target Indication and Imaging Technique of Airborne SAR** Jian

Yang, 2017-01-09 Based on a detailed analysis of the signal model of the moving target, this thesis focuses on the theories and applications of ground moving target indicator GMTI and ground moving target imaging GMTIm algorithms in synthetic aperture radar ground moving target indicator SAR GMTI mode wide area surveillance ground moving target indication WAS GMTI mode and frequency modulated continuous wave synthetic aperture radar FMCW SAR systems. The proposed algorithms can not only indicate and image fast moving targets but are also effective in the context of slow moving target processing. The system design scheme combines the mechanical scanning mode and the airborne SAR system while the azimuth moving target indication algorithm employs the additional range walk migration induced by FMCW SAR systems. In addition, the non ideal errors that deteriorate the performance of GMTIm algorithms in real SAR data processing are discussed and suitable compensation methods are provided. *Design Technology of Synthetic Aperture Radar* Jiaguo Lu, 2019-07-01 An authoritative work on Synthetic Aperture Radar system engineering with key focus on high resolution

presents problems related to traditional methods of synthesis and analysis of the main digital signal processing operations. It also examines problems related to modern methods of robust signal processing in noise with a focus on the generalized approach to signal processing in noise under coherent filtering. In addition, the book puts forth a new problem statement and new methods to solve problems of adaptation and control by functioning processes. Taking a systems approach to designing complex radar systems, it offers readers guidance in solving optimization problems. Organized into three parts, the book first discusses the main design principles of the modern robust digital signal processing algorithms used in complex radar systems. The second part covers the main principles of computer system design for these algorithms and provides real world examples of systems. The third part deals with experimental measurements of the main statistical parameters of stochastic processes. It also defines their estimations for robust signal processing in complex radar systems. Written by an internationally recognized professor and expert in signal processing, this book summarizes investigations carried out over the past 30 years. It supplies practitioners, researchers, and students with general principles for designing the robust digital signal processing algorithms employed by complex radar systems.

Time-frequency Transforms for Radar Imaging and Signal Analysis Victor C. Chen, Hao Ling, 2002. Here's an innovative hands-on book on time frequency transforms for radar imaging and signal analysis. It teaches you more efficient ways to extract dispersive scattering features, detect and extract weak signals in noise from clear radar images, estimate parameters, and perform motion compensation. Detect and track moving targets in the synthetic aperture radar and analyze vibration and rotation induced micro Doppler. This unique resource introduces a new image formation algorithm based on time frequency transforms, showing its advantage over the more conventional Fourier based image formation. Referenced with over 170 equations and 80 illustrations, the book presents new algorithms that help improve the result of radar imaging and signal processing. Moreover, the authors discuss future trends in time frequency to analyze micro Doppler and provide you with a newly developed time frequency approach to radar signal and image processing to help you solve problems associated with conventional approaches.
