Dietary Supplements of Plant Origin Massimo Maffei,2003-05-22 Dietary supplements are estimated to be used regularly by almost 60% of the American population and over 300 million people worldwide An important and ever growing portion of this market is in botanical supplements that are derived from natural plants Natural however does not necessarily mean safe and although plants can provide health essential and health improving nutrients they can also provide toxic compounds While the use and sales of botanical supplements continues to expand rapidly scientific understanding of the efficacy and safety of these products remains limited The aim of Dietary Supplements of Plant Origin is to give both the general and specialized reader a comprehensive insight into the most recent findings in this interesting area of dietary supplementation It is hoped that this book will shed a new light on this topic and impact positively upon the health of people in this new millennium

Plant Communication from an Ecological Perspective František Baluška,Velemir Ninkovic,2010-08-05 Since the concept of allelopathy was introduced almost 100 years ago research has led to an understanding that plants are involved in complex communicative interactions They use a battery of different signals that

convey plant relevant information within plant individuals as well as between plants of the same species or different species. The 13 chapters of this volume discuss all these topics from an ecological perspective. Communication between plants allows them to share physiological and ecological information relevant for their survival and fitness. It is obvious that in these very early days of ecological plant communication research we are illuminating only the tip of iceberg of the communicative nature of higher plants. Nevertheless knowledge on the identity and informative value of volatiles used by plants for communication is increasing with breath taking speed. Among the most spectacular examples are situations where plant emitters warn neighbours about a danger increasing their innate immunity or when herbivore attacked plants attract the enemies of the herbivores cry for help and plant bodyguards concepts. It is becoming obvious that plants use not only volatile signals but also diverse water soluble molecules in the case of plant roots to safeguard their evolutionary success and accomplish self non self kin recognition. Importantly as with all the examples of biocommunication irrespective of whether signals and signs are transmitted via physical or chemical pathways plant communication is a rule governed and sign mediated process.

Perspectives for Biodiversity and Ecosystems Carsten Hobohm, 2021-02-05. The novelty of the book is a strong focus on perception perspectives and prediction by scientists with profound insight into the ecology of ecosystems or into human demands and activity. The challenge is to bridge from empirical data and the knowledge of the past to the possibilities of the performance in the future. We assume that there is scope for more cooperation between the fields of ecology and practical philosophy or other social sciences in organising ecosystems and shaping the cultural future of humankind and that such collaboration should be accorded considerably more priority. This book deals with environmental processes seen within a framework of the nature of ecosystems and human cultures. The future of the environment the development of ecosystems and effective nature conservation management are the essentials of this book. Human nature and culture and in particular their interactions are interpreted as a set of rules and as given. The aim is not only to assess the significance of human influence on species composition and biodiversity but also to weigh up the subsequent potentials for action. In this book we will analyze the problems independently of one another even if they are interconnected. This book focuses on perspectives and prognoses for the impacts of anthropogenic activity on ecosystems and thus on species conservation. Its goal is to improve assessments of the impacts of human activity on the environment. We are aware that prognoses have very often proven to be false. It is difficult to impossible to be able to predict with precision how evolution and ecosystems will change in future under anthropogenic influence. This strengthens our resolve to attempt to retain the highest possible degree of scientific integrity and professionalism and not to shy away from expressing the uncertainty of our own ideas and prognoses. We venture prognoses in this book and we will fail. However we hope that we will be wrong on the right side.

Plant-Microbe Interactions in Agro-Ecological Perspectives Dhananjaya Pratap Singh, Harikesh Bahadur Singh, Ratna Prabha, 2017-09-27 This book presents an updated compilation on fundamental interaction mechanisms of microbial communities with the plant roots and rhizosphere belowground and leaves and aerial parts aboveground. The plant rhizosphere recruits its own microbial composition that survives there and helps plants grow and develop better under biotic and abiotic conditions. Similar is the case with the beneficial microorganisms which are applied as inoculants with characteristic functions. The mechanism of plant-microbe interactions is an interesting phenomenon in biological perspectives with numerous implications in the fields. The first volume focuses on the basic and fundamental mechanisms that have been worked out by the scientific communities taking into account different plant-microbe systems. This includes methods that decipher mechanisms at cellular, physiological, biochemical, and molecular levels and the functions that are the final outcome of any beneficial or non-beneficial interactions in crop plants and microbes. Recent advances in this research area are covered in different book chapters that reflect the impact of microbial interactions on soil and plant health dynamics of rhizosphere microbial communities, interaction mechanisms of microbes with multiple functional attributes, microbiome of contrasting crop production systems, organic vs. conventional mechanisms behind symbiotic and pathogenic interactions, endophytic bacterial and fungal interaction and benefits, rhizoplane and endosphere associations, signalling cascades and determinants in rhizosphere quorum sensing in bacteria and impact on interaction, mycorrhizal interaction mechanisms, induced disease resistance and plant immunization, interaction mechanisms that suppress disease and belowground microbial crosstalk with plant rhizosphere. Methods based on multiphasic and multi-omics approaches were discussed in detail by the authors. Content-wise the book offers an advanced account on various aspects of plant-microbe interactions and valuable implications in agro-ecological perspectives.
