Pesticide Removal By Combined Ozonation And Granular Activated Carbon Filtration:

Pesticide Removal by Combined Ozonation and Granular Activated Carbon Filtration Ervin Orlandini, 2018-12-19

This research aimed to identify and understand mechanisms that underlie the beneficial effect of ozonation on removal of pesticides and other micropollutants by Granular Activated Carbon (GAC) filtration. This allows optimization of the combination of these two processes termed Biological Activated Carbon filtration. The study concluded that ozonation significantly improves removal of atrazine by GAC filtration not only due to the well-known effect of oxidation of atrazine but also due to the effect of partial oxidation of Background Organic Matter (BOM) present in water. Ozone-induced oxidation of BOM was found to improve adsorption of atrazine in GAC filters. Biodegradation of atrazine in these filters was not demonstrated. Higher GAC's adsorption capacity for atrazine and faster atrazine's mass transfer in filters with ozonated rather than non-ozonated influent were explained as due to ozonated BOM. Both can be attributed to enhanced biodegradability and reduced adsorbability of partially oxidized BOM compounds resulting in their increased biodegradation and decreased adsorption in GAC filters.

Scaling and Particulate Fouling in Membrane Filtration Systems S.F.

Boerlage, 2001-01-01 Reliable methods to predict membrane scaling and fouling are important tools in the control of these phenomena. This dissertation focuses on the development and application of methods to predict and prevent barium sulphate scaling and particulate fouling in membrane filtration systems.

Effectiveness of Bank Filtration for Water Supply in

Arid Climates Ahmed Ragab Abdelrady Mahmoud, 2021-02-25 In many developing countries water demand is increasing while surface and groundwater resources are threatened by pollution and overexploitation. Hence a more sustainable approach to water resources management and water treatment is required. In this capacity bank filtration is a natural treatment process that makes use of the storage and contaminant attenuation capacity of natural soil rock. However, BF is site specific and a significant knowledge gap exists regarding the design and management of bank filtration systems particularly in developing countries. This research aimed to address these gaps and contribute to the transfer of bank filtration to developing countries. This study comprised both column and batch laboratory scale experiments to determine the effect of environmental variables such as temperature, raw water organic composition and redox conditions on the removal of chemical pollutants such as organic matter, micro pollutants and heavy metals as well as the mobility of iron, manganese and arsenic under anaerobic conditions. Ultimately the effectiveness of BF for supplying high drinking water quality was assessed in a case study in Egypt. The study showed that more than 80% of biodegradable organic matter was removed during infiltration at temperatures between 20 and 30 °C. However, humic compounds enriched during BF required post treatment. Moreover, high humic content of infiltrating water reduced the removal of heavy metal and promoted the release of metal ions into the infiltrating water, rendering it more feasible to install BF wells within surface water systems with low levels of

organic matter Moderately hydrophobic organic micropollutants were most persistent and required infiltration times longer than 30 days for complete elimination even at high temperatures 20 C Finally design parameters such as the number of infiltration wells should be configured to minimise the proportion of polluted groundwater in the pumped water Overall this study provides insight into the effectiveness of BF in removing chemical pollutants from surface water and proposes guidelines for the successful application of BF in developing countries where arid conditions and high temperatures prevail

Reckhow,Deborah R Brink,2019-07-16 With the advent of the

Safe Drinking Water Act Amendments of 1986 many water utilities are reexamining their water treatment practices. Upcoming new regulations on disinfection and on disinfection by products in particular are the primary driving forces for the big interest in ozone. It appears that ozone with its strong disinfection capabilities and apparently lower levels of disinfection by products compared to other disinfectants may be the oxidant disinfectant of choice. Many utilities currently using chlorine for oxidation may need to switch due to chlorine by product concerns. Utilities using chloramines may need to use ozone to meet CT requirements. This book prepared by 35 international experts includes current technology on the design, operation and control of the ozone process within a drinking water plant. It combines almost 100 years of European ozone design and operating experience with North American design, operations experience and the North American regulatory and utility operational environment. Topics covered include ozone chemistry, toxicology, design considerations, engineering aspects, design of retrofit systems and the operation and economics of ozone technology. The book contains a how-to section on ozone treatability studies which explains what information can be learned using treatability studies at what scale: bench, pilot or demonstration plant and how this information can be used to design full scale systems. It also includes valuable tips regarding important operating practices as well as guidance on retrofits and the unique issues involved with retrofitting the ozone process. With ozone being one of the hottest areas of interest in drinking water, this book will prove essential to all water utilities, design engineers, regulators and plant managers and supervisors.
