Rapid Prototyping Of Application Specific Signal Processors:

Rapid Prototyping of Application Specific Signal Processors Mark A. Richards, Anthony J. Gadiant, Geoffrey A. Frank, 1997-02-28 Rapid Prototyping of Application Specific Signal Processors presents leading edge research that focuses on design methodology infrastructure support and scalable architectures developed by the 150 million dollar DARPA United States Department of Defense RASSP Program The contributions to this edited work include an introductory overview chapter that explains the origin concepts and status of this effort The RASSP Program is a multi year DARPA Tri Service initiative intended to dramatically improve the process by which complex digital systems particularly embedded signal processors are designed manufactured upgraded and supported This program was originally driven by military applications for signal processing The requirements of military applications for real time signal processing are typically more demanding than those of commercial applications but the time gap between technology employed in advanced military prototypes and commercial products is narrowing rapidly The research on methodologies infrastructure and architectures presented in this book is applicable to commercial signal processing systems that are in design now or will be developed before the end of the decade Rapid Prototyping of Application Specific Signal Processors is a valuable reference for developers of embedded digital systems particularly systems engineers for signal processing systems such as digital TV biomedical image processing systems and telecommunications and for military contractors who are developing signal processing systems This book will also be of interest to managers who are charged with responsibility for creating and maintaining environments and infrastructures for developing large embedded digital systems The chief value for managers will be the defining of methods and processes that reduce development time and cost

Rapid Prototyping of Application Specific Signal Processors Program, 1992 This report discusses the results of the TI RASSP study efforts to identify a development process consistent with the RASSP program methodology In this study we defined the concept of a library based system design approach with in cycle and out of cycle development of library elements This report discusses this approach and the issues associated with system hardware and software design tools and manufacturing foundry interfaces required to support a library based system development approach The library based development concept is defined and the modularity and partitioning of a domain specific architecture is discussed A description of the library elements supporting a library based system design approach is provided Requirements issues and approaches to signal processing system design analyses and tradeoffs and system simulation and validation are discussed Data base representation issues frame words and interfaces required to provide a seamless RASSP development environment are identified Reusable software and library element development issues are addressed Hardware CAD issues associated with library element development system analyses simulation and validation are discussed Manufacturing foundry CAD CIM design tool interfaces and test issues are also discussed A summary of the effort and recommendations for implementation are also included

Rapid Prototyping of Application Specific Signal

Processors (RASSP). ,1993 This document provides for each of the computer aided design CAD tools in the initial baseline RAASP design environment a description of its role in the environment an assessment of strengths and weaknesses and manufacturer s contact information This RASSP initial design environment is summarized in Table 1 which specified the tool name the manufacturer and a short description of each tool The detailed description and assessment of each tool comprises the remainder of this document following the introduction

Application Specific Processors Earl E. Swartzlander Jr.,2012-12-06 Application Specific Processors is written for use by engineers who are developing specialized systems application specific systems Traditionally most high performance signal processors have been realized with application specific processors The explanation is that application specific processors can be tailored to exactly match the usually very demanding application requirements The result is that no processing power is wasted for unnecessary capabilities and maximum performance is achieved A disadvantage is that such processors have been expensive to design since each is a unique design that is customized to the specific application In the last decade computer aided design systems have been developed to facilitate the development of application specific integrated circuits The success of such ASIC CAD systems suggests that it should be possible to streamline the process of application specific processor design Application Specific Processors consists of eight chapters which provide a mixture of techniques and examples that relate to application specific processing The inclusion of techniques is expected to suggest additional research and to assist those who are faced with the requirement to implement efficient application specific processors The examples illustrate the application of the concepts and demonstrate the efficiency that can be achieved via application specific processors The chapters were written by members and former members of the application specific processing group at the University of Texas at Austin The first five chapters relate to specific arithmetic which often is the key to achieving high performance in application specific processors The next two chapters focus on signal processing systems and the final chapter examines the interconnection of possibly disparate elements to create systems

Specification and Design Methodology for Real-Time Embedded Systems Randall S. Janka,2012-12-06 Specification and design methodology has seen significant growth as a research area over the last decade tracking but lagging behind VLSI design technology in general and the CAD industry in particular The commercial rush to market tries to leverage existing technology which fuels CAD design tool development Paralleling this is very active basic and applied research to investigate and move forward rational and effective methodologies for accomplishing digital design especially in the field of hardware software codesign It is this close relationship between industry and academia that makes close cooperation between researchers and practitioners so important and monographs like this that combine both abstract concept and pragmatic implementation deftly bridge this often gaping chasm It was at the IEEE ACM Eighth International Symposium on Hardware Software Codesign where I met the author of this monograph Dr Randall Janka who was presenting some of his recent dissertation research results on specification and design methodology or as he has so succinctly defined

this sometimes ambiguous concept the tools and rules Where so many codesign researchers are trying to prove out different aspects of codesign and using toy applications to do so Dr Janka had developed a complete specification and design methodology and prototyped the infrastructure and proven its viability utility and effectiveness using a demanding real world application of a real time synthetic aperture radar imaging processor that was implemented with embedded parallel processors

Embedded Processor Design Challenges Ed F. Deprettere, Stamatis Vassiliadis, 2003-07-31 This textbook is intended to give an introduction to and an overview of state of the art techniques in the design of complex embedded systems The book title is SAMOS for two major reasons First it tries to focus on the actual distinct yet important problems of System Level design of embedded systems including mapping techniques and synthesis Architectural design Modeling issues such as specification languages formal models and finally Simulation The second reason is that the volume includes a number of papers presented at a workshop with the same name on the Island of Samos Greece in July 2001 In order to receive international attention a number of reputed researchers were invited to this workshop to present their current work Participation was by invitation only For the volume presented

here a number of additional papers were selected based on a call for papers. All contributions were refereed. This volume presents a selection of 18 of the refereed papers, including 2 invited papers. The textbook is organized according to four topics. The first is *A System Level Design and Simulation*. In this section, we present a collection of papers that give an overview of the challenging goal to design and explore alternatives of embedded system implementations at the system level. One paper gives an overview of models and tools used in system level design. The other papers present new models to describe applications, provide models for refinement and design space exploration, and for trade-off analysis between cost and flexibility of an implementation.
