Recent Advances In Algorithms And Combinatorics:

Recent Advances in Algorithms and Combinatorics Bruce A. Reed, Claudia L. Linhares-Sales, 2006-05-17 Combinatorics is one of the fastest growing fields of mathematics. In large measure this is because many practical problems can be modeled and then efficiently solved using combinatorial theory. This real world motivation for studying algorithmic combinatorics has led not only to the development of many software packages but also to some beautiful mathematics which has no direct application to applied problems. In this volume we highlight some exciting recent developments in algorithmic combinatorics. Most practical applications of algorithmic combinatorics would be possible without the use of the computer. As computers become ever more powerful more and more applications become possible. Computational biology is one example of a relatively new field in which algorithmic combinatorics plays a key role. The chapter by Sagot and Wakabayashi in this volume discusses how combinatorial tools can be used to search for patterns in DNA and protein sequences. The information technology revolution has not only allowed for the resolution of practical problems using combinatorial techniques it has also been the source of many new combinatorial problems. One example is radio channel assignment. In this problem we have a number of transmitters each of which must handle a number of calls. Each call must be assigned a frequency in such a way that interference is avoided thus calls handled by the same transmitter are assigned different frequencies as are calls handled by transmitters which are near each other. The explosive growth in the use of the frequency spectrum due to e.g. mobile telephone networks has made it a very valuable resource.

Approximation Algorithms and Semidefinite Programming Bernd Gärtner, Jiri Matousek, 2012-01-10 Semidefinite programs constitute one of the largest classes of optimization problems that can be solved with reasonable efficiency both in theory and practice They play a key role in a variety of research areas such as combinatorial optimization approximation algorithms computational complexity graph theory geometry real algebraic geometry and quantum computing This book is an introduction to selected aspects of semidefinite programming and its use in approximation algorithms It covers the basics but also a significant amount of recent and more advanced material There are many computational problems such as MAXCUT for which one cannot reasonably expect to obtain an exact solution efficiently and in such case one has to settle for approximate solutions For MAXCUT and its relatives exciting recent results suggest that semidefinite programming is probably the ultimate tool Indeed assuming the Unique Games Conjecture a plausible but as yet unproven hypothesis it was shown that for these problems known algorithms based on semidefinite programming deliver the best possible approximation ratios among all polynomial time algorithms This book follows the semidefinite side of these developments presenting some of the main ideas behind approximation algorithms based on semidefinite programming It develops the basic theory of semidefinite programming presents one of the known efficient algorithms in detail and describes the principles of some others It also includes applications focusing on approximation algorithms

Graph-Theoretic Concepts in Computer Science Hans L. Bodlaender, 2003-10-27 The 29th International Workshop on Graph Theoretic Concepts in Computer

Science WG2003 was held in the Mennorode conference Center in Elspeet The Netherlands

The workshop was organized by the Center for Algorithmic Systems of the Institute of Information and Computing Sciences of Utrecht University. The workshop took place June 19-21, 2003. The 72 participants of WG 2003 came from universities and research institutes from 18 different countries and several different continents. The workshop looks back at a long tradition. It was first held in 1975 and has been held 20 times in Germany, twice in Austria and once in Italy, Slovakia, Switzerland and the Czech Republic and has now been held for the third time in The Netherlands. The workshop aims at uniting theory and practice by demonstrating how graph theoretic concepts can be applied to various areas in computer science or by extracting new problems from applications. It is devoted to the theoretical and practical aspects of graph concepts in computer science. The goal is to present recent research results and to identify and explore directions of future research. The talks given at the workshop showed how recent research results from algorithmic graph theory can be used in computer science and which graph theoretic questions arise from new developments in computer science.
