

# T Cell Receptor Structure and Function

## Structure

The T cell receptor (TCR) is a transmembrane protein complex, consisting of an  $\alpha$  and  $\beta$  chain, each with a variable and constant region. TCRs are associated with CD3 proteins, which mediate signal transduction.

## Diversity

TCR diversity is generated through V(D)J recombination, enabling T cells to recognize a wide range of peptide antigens.

## Function

TCRs recognize short peptide fragments presented by MHC molecules on antigen-presenting cells (APCs). This interaction initiates T cell activation and differentiation into effector cells.

*Receptors* Clare Stanford, Roger W. Horton, 2001 Given the number of exciting developments across the whole spectrum of receptor research in recent years the editors have not restricted themselves to one particular approach or class of receptors Thus the studies within range from G protein coupled surface receptors to the delivery of antisense DNA inside living cell systems A distinguished team of contributors cover these diverse areas identifying any difficulties likely to be encountered and appropriate steps to overcome them Wherever appropriate the theoretical basis of each topic is explained first so that the results emerging from the practical procedures can be fully understood Anyone with an interest in receptor structure and function will find this book an invaluable resource [Hormone Receptors: Structures and Functions](#)

Giraldo, Jean-Philippe Pin, 2011-08-16 G protein coupled receptors GPCRs are the largest family of cell surface receptors with more than 800 members identified thus far in the human genome They regulate the function of most cells in the body and represent approximately 3% of the genes in the human genome These receptors respond to a wide variety of structurally diverse ligands ranging from small molecules such as biogenic amines nucleotides and ions to lipids peptides proteins and even light Ligands agonists and antagonists acting on GPCRs are important in the treatment of numerous diseases including cardiovascular and mental disorders retinal degeneration cancer and AIDS It is estimated that these receptors represent about one third of the actual identified targets of clinically used drugs The determination of rhodopsin crystal structure and more recently of opsin 1 and 2 adrenergic and A2A adenosine receptors provides both academia and industry with extremely valuable data for a better understanding of the molecular determinants of receptor function and a more reliable rationale for drug design GPCR structure and function constitutes a hot topic The book which lies between the fields of chemical biology molecular pharmacology and medicinal chemistry is divided into three parts The first part considers what receptor structures tell us about the mechanism of receptor activation Part II focuses on receptor function It discusses what the data from

biophysical and mutational studies and the analysis of the interactions of the receptor with ligands and regulator proteins tell us about the process of signal transduction The final part on modelling and simulation details new insights on the link between structure and mechanism and their implications in drug design G-protein Coupled Receptors ,1997

The Physiology and Pharmacology of Leucine-rich Repeat GPCRs Brian J. Arey, James A. Dias, 2016-08-05 G protein coupled receptors GPCRs represent a large and physiologically important class of cell surface receptors There are approximately 750 known GPCRs present in the human genome that can be subdivided into general classes based upon sequence homology within their transmembrane domains Therapeutically GPCRs represent a fertile source for the development of therapies as they are a significant percentage of our current pharmacopeia Among the three subclasses of GPCRs the Class A rhodopsin like receptors are by far the most prevalent and extensively studied However within the Class A receptors sub families of receptors can be distinguished based upon common sequence motifs within the transmembrane domains as well as extracellular and intracellular domains One such family of Class A receptors is characterized by multiple leucine rich repeats within their amino terminal domains the Leucine rich Repeat family LRR This family of GPCRs are best represented by the glycoprotein hormone receptors LHR FSHR and TSHR which have been studied extensively but also includes receptors for the peptide hormone relaxin RXFP1 and RXFP2 RXFP2 also binds insulin like peptide 3 and three other receptors LGR4 LGR5 and LGR6 LGR4 6 were until recently considered orphan receptors However emerging data have revealed that these proteins are the receptors for a family of growth factors called R spondins Over the last 20 years much has been learned about LRR receptors including the development of synthetic agonists and antagonists new insights into signaling including signaling bias and the physiological role these receptors play in regulating the function of many tissues This topic will focus on what is known concerning the regulation of these receptors their signaling pathways functional consequences of activation and pharmacology
