Rethinking Innateness Connectionist Perspective On Development:

Rethinking Innateness Jeffrey L. Elman, 1996 *Rethinking Innateness* asks the question What does it really mean to say that a behavior is innate The authors describe a new framework in which interactions occurring at all levels give rise to emergent forms and behaviors These outcomes often may be highly constrained and universal yet are not themselves directly contained in the genes in any domain specific way One of the key contributions of *Rethinking Innateness* is a taxonomy of ways in which a behavior can be innate These include constraints at the level of representation architecture and timing typically behaviors arise through the interaction of constraints at several of these levels The ideas are explored through dynamic models inspired by a new kind of developmental connectionism a marriage of connectionist models and developmental neurobiology forming a new theoretical framework for the study of behavioral development While relying heavily on the conceptual and computational tools provided by connectionism *Rethinking Innateness* also identifies ways in which these tools need to be enriched by closer attention to biology

Rethinking Innateness, 1996 [Exercises in Rethinking Innateness](#) Kim Plunkett, Jeffrey Elman, 1997-04-15 This book is the companion volume to *Rethinking Innateness* A Connectionist Perspective on Development The MIT Press 1996 which proposed a new theoretical framework to answer the question What does it mean to say that a behavior is innate The new work provides concrete illustrations in the form of computer simulations of properties of connectionist models that are particularly relevant to cognitive development This enables the reader to pursue in depth some of the practical and empirical issues raised in the first book The authors larger goal is to demonstrate the usefulness of neural network modeling as a research methodology The book comes with a complete software package including demonstration projects for running neural network simulations on both Macintosh and Windows 95 It also contains a series of exercises in the use of the neural network simulator provided with the book The software is also available to run on a variety of UNIX platforms

Scott Johnson, 2010 Arguments over the developmental origins of human knowledge are ancient founded in the writings of Plato Aristotle Descartes Hume and Kant They have also persisted long enough to become a core area of inquiry in cognitive and developmental science Empirical contributions to these debates however appeared only in the last century when Jean Piaget offered the first viable theory of knowledge acquisition that centered on the great themes discussed by Kant object space time and causality The essence of Piaget's theory is constructivism The building of concepts from simpler perceptual and cognitive precursors in particular from experience gained through manual behaviors and observation The constructivist view was disputed by a generation of researchers dedicated to the idea of the competent infant endowed with knowledge say of permanent objects that emerged prior to facile manual behaviors Taking this possibility further it has been proposed that many fundamental cognitive mechanisms reasoning event prediction decision making hypothesis testing and deduction operate independently of all experience and are in this sense innate The competent infant view has an intuitive appeal attested to by its widespread popularity and it enjoys a kind of parsimony It avoids the supposed philosophical pitfall posed by having to account for novel forms of knowledge in inductive learners But this view leaves unaddressed a vital challenge to understand the mechanisms by which new knowledge arises This challenge has now been met The neoconstructivist approach is rooted in Piaget's constructivist emphasis on developmental mechanisms yet also reflects modern advances in our understanding of learning mechanisms cortical development and modeling This book brings together for the first time theoretical views that embrace computational models and developmental neurobiology and emphasize the interplay of time experience and cortical architecture to explain emergent knowledge with an empirical line of research identifying a set of general purpose sensory perceptual and learning mechanisms that guide knowledge acquisition across different domains and through development
