Radar Range-Performance Analysis

L. V. Blake.

Artech House, Incorporated, Norwood, MA, 1986. 443 pp. Illustrated. £60.00.

This book, which is a comprehensive review of the ability of a radar to detect and track its target, is a re-publication of a well respected text. It has been appropriately updated and used as a text for teaching intensive short courses, so it includes clear descriptions of basic principles. As a separate publication, sets of problems and answers have been designed to aid the understanding of each chapter.

The first chapter contains a thorough discussion of the radar range equation and the significance of each of the parameters; this includes monostatic and bistatic radars and the effect of clutter and jamming. The chapter on the detection of signals was contributed by L. W. Brooks; this covers the automatic detection of pulse signals in receiver noise, and single and multiple pulse detection of static and fluctuating targets. The chapter on target cross section discusses the Rayleigh, resonant and optical scattering regimes and gives RCS formulas for basic shapes. There is also a discussion of methods for measurement of RCS, and their applicability to full scale dynamic measurements and sub-scale measurements in controlled environments. Subsequent chapters consider the effect of noise; propagation effects in the earth's

atmosphere; multipath effects; clutter, interference and signal processing; pulse-radar detection-range computation, and special types of radar.

Within its 443 pages the book presents a clear and accurate picture of the subject, and the order of presentation helps the reader rapidly to develop a grasp of the subject. The illustrations are clear and concise and copious references are made to the unclassified literature. The book should become a standard reference on radar performance.

Gas Turbine Theory — Third edition

H. Cohen et al.

Longman Scientific & Technical, Harlow, 1987. 414 pp. Illustrated. £19.95.

This is the third edition of a book which was originally published in 1951 and has become regarded as a standard introduction to the subject.

The book is primarily intended for students to supplement their lecture course but would also serve as a useful introduction to practising engineers who have been engaged on other types of power plant and are now undertaking gas-turbine work.

The book deals with the basic physics and theory and does not extend to cover modern computational methods. In addi-

tion it does not attempt to cover control systems, mechanical design features or stressing.

This edition contains considerable updating compared with the previous edition to reflect the advances and developments which have taken place in the gas turbine industry. The section on shaft power cycles now includes gas and steam cycles, cogeneration schemes and closed cycles, the chapter on axial flow compressors has been enlarged and a section on radial flow turbines has been added to the chapter on turbines.

The introductory chapter summarises the various types of gas turbine and their application and the subsequent two chapters deal in more detail with the various shaft power cycles and cycles for aircraft propulsion respectively.

There are then chapters on centrifugal compressors, axial compressors, combustion systems and turbines which explain the basic principles, design methods and the interpretation of performance.

The subsequent chapters deal with overall engine performance prediction including off-design and transient performance.

There are finally some notes on various aspects of gas dynamics.

A volume of this size can obviously only deal with the basic principles and, as such, this latest edition is excellent. It will prove of great value to those for whom the authors intended it as an introduction to the subject of Gas Turbine Theory.
