almost all topics related to sensor networks gives an amazing number of references and thus is the perfect source for students teachers and researchers Throughout the book the reader will find high quality text figures formulas comparisons etc all you need for a sound basis to start sensor network research Prof Jochen Schiller Institute of Computer Science Freie Universität Berlin *Ernst Denert Award for Software Engineering 2020* Michael Felderer, Wilhelm Hasselbring, Heiko Koziol, Florian Matthes, Lutz Prechelt, Ralf Reussner, Bernhard Rumpe, Ina Schaefer, 2022-02-28 This open access book provides an overview of the dissertations of the eleven nominees for the Ernst Denert Award for Software Engineering in 2020 The prize kindly sponsored by the Gerlind Ernst Denert Stiftung is awarded for excellent work within the discipline of Software Engineering which includes methods tools and procedures for better and efficient development of high quality software An essential requirement for the nominated work is its applicability and usability in industrial practice The book contains eleven papers that describe the works by Jonathan Brachthuser EPFL Lausanne entitled What You See Is What You Get Practical Effect Handlers in Capability Passing Style Mojdeh Golagha's Fortiss Munich thesis How to Effectively Reduce Failure Analysis Time Nikolay Harutyunyan's FAU Erlangen Nürnberg work on Open Source Software Governance Dominic Henze's TU Munich research about Dynamically Scalable Fog Architectures Anne Hess's Fraunhofer IESE Kaiserslautern work on Crossing Disciplinary Borders to Improve Requirements Communication Istvan Koren's RWTH Aachen University thesis DevOps Use A Community Oriented Methodology for Societal Software Engineering Yannic Noller's NUS Singapore work on Hybrid Differential Software Testing Dominic Steinhofel's TU Darmstadt thesis entitled Ever Change a Running System Structured Software Reengineering Using Automatically Proven Correct Transformation Rules Peter Wagemann's FAU Erlangen Nürnberg work Static Worst Case Analyses and Their Validation Techniques for Safety Critical Systems Michael von Wenckstern's RWTH Aachen University research on Improving the Model Based Systems Engineering Process and Franz Zieris's FU Berlin thesis on Understanding How Pair Programming Actually Works in Industry Mechanisms Patterns and Dynamics which actually won the award The chapters describe key findings of the respective works show their relevance and applicability to practice and industrial software engineering projects and provide additional information and findings that have only been discovered afterwards e.g. when applying the results in industry This way the book is not only interesting to other researchers but also to industrial software professionals who would like to learn about the application of state of the art methods in their daily work **Artificial Intelligence for Edge Computing** Mudhakar Srivatsa, Tarek Abdelzaher, Ting He, 2023-12-21 It is undeniable that the recent revival of artificial intelligence AI has significantly changed the landscape of science in many application domains ranging from health to defense and from conversational interfaces to autonomous cars With terms such as Google Home Alexa and ChatGPT becoming household names the pervasive societal impact of AI is clear Advances in AI promise a revolution in our interaction with the physical world a domain where computational intelligence has always been envisioned as a transformative force toward a better tomorrow Depending on the application family this domain is often

referred to as Ubiquitous Computing Cyber Physical Computing or the Internet of Things The underlying vision is driven by the proliferation of cheap embedded computing hardware that can be integrated easily into myriads of everyday devices from consumer electronics such as personal wearables and smart household appliances to city infrastructure and industrial process control systems One common trait across these applications is that the data that the application operates on come directly typically via sensors from the physical world Thus from the perspective of communication network infrastructure the data originate at the network edge From a performance standpoint there is an argument to be made that such data should be processed at the point of collection Hence a need arises for Edge AI a genre of AI where the inference and sometimes even the training are performed at the point of need meaning at the edge where the data originate The book is broken down into three parts core problems distributed problems and other cross cutting issues It explores the challenges arising in Edge AI contexts Some of these challenges such as neural network model reduction to fit resource constrained hardware are unique to the edge environment They need a novel category of solutions that do not parallel more typical concerns in mainstream AI Others are adaptations of mainstream AI challenges to the edge space An example is overcoming the cost of data labeling The labeling problem is pervasive but its solution in the IoT application context is different from other contexts This book is not a survey of the state of the art With thousands of publications appearing in AI every year such a survey is doomed to be incomplete on arrival It is also not a comprehensive coverage of all the problems in the space of Edge AI Different applications pose different challenges and a more comprehensive coverage should be more application specific Instead this book covers some of the more endemic challenges across the range of IoT CPS applications To offer coverage in some depth we opt to cover mainly one or a few representative solutions for each of these endemic challenges in sufficient detail rather than broadly touching on all relevant prior work The underlying philosophy is one of illustrating by example The solutions are curated to offer insight into a way of thinking that characterizes Edge AI research and distinguishes its solutions from their more mainstream counterparts
