**Insecticides Design Using Advanced Technologies** Isaac Ishaaya, Ralf Nauen, A. Rami Horowitz, 2007-02-15 In the past insecticide development has been guided mostly by chemo rational and bio rational design based on understanding of the physiology and ecology of insects and crops A limitation in each new class of compounds is the evolution of resistance in populations of key pests which ultimately leads to control failures This phenomenon and the desire to produce more selective and biorational compounds serve as the driving force to develop advanced technologies for insecticide design Among the highlights of this book are the use of nanotechnology to increase potency of available insecticides the use of genetic engineering techniques for controlling insect pests the development of novel insecticides that bind to unique biochemical receptors the exploration of natural products as a source for environmentally acceptable insecticides and the use of insect genomics and cell lines for determining biological and biochemical modes of action of new insecticides

Blondelle, 2007-10-23 This book represents proceedings of the 19th American Peptide Symposium It highlights many of the recent developments in peptide science with a particular emphasis on how these advances are being applied to basic problems in biology and medicine Specific topics covered include novel synthetic strategies peptides in biological signaling post translational modifications of peptides and proteins and peptide quaternary structure in material science and disease

*Behavioural Ecotoxicology* Giacomo Dell'Omo, 2002-05-22

Behavioural ecotoxicology is an emerging field dealing with the effects of environmental pollutants on the behaviour of animals. Behavioural techniques derived from experimental psychology, behavioural pharmacology and neurotoxicology are applied to detect and characterise changes in animals living in the environment exposed to various pollutants. Behavioural effects are then interpreted in an ecological context considering the long term relevance of these changes at both the individual and population level.

**Lobsters: Biology, Fisheries and Aquaculture** E. V. Radhakrishnan, Bruce F. Phillips, Gopalakrishnan Achamveetil, 2019-11-28. This book is an important addition to the knowledge of lobster research. The book complements other books published on lobster research and management as it focuses on Indian lobster fisheries and aquaculture developments where there have been nearly 350 research papers and reports and 19 PhD awards. The book has 15 chapters written by international experts covering many aspects of the biology of a number of spiny and slipper lobster species occurring in India and world oceans with maps illustrating global distribution of spiny lobster families, genera and species. An updated taxonomy and checklist of marine lobsters, the status and management of lobster fisheries in India and Indian Ocean Rim countries and a review of aquaculture research in India and other major countries have also been presented. The book is timely as the 2nd International Indian Ocean Expedition (IIOE) is currently underway. 2015-2020, 50 years after the original IIOE 1959-1965 with some of the original lobster research on the biology and distribution of phyllosoma larvae being undertaken on the plankton samples collected during the first IIOE. Many of the chapters are contributed by the authors from Central Marine Fisheries Research Institute (CMFRI) which has been collecting fishery and biological data on lobsters since 1950 when lobster fishing began on a subsistence scale followed by some industrial fishing for lobsters in different parts of India. Unfortunately, the development of some of these lobster fisheries was followed by overfishing due to lack of enforcement of regulations. The book provides a valuable addition to our knowledge of the biology, fisheries and aquaculture of spiny and slipper lobsters.

**Bioenergetics and Energy Metabolism in Crustaceans** Bhaskar L.V.K.S., 2016-02-04. Bioenergetics is the study of balance between energy supply and energy expenditure and requires an examination of physiological processes through which energy is transformed in living organisms. Studies on the flow and allocation of energy in biological systems often have as their ultimate goal the construction of a budget describing the partitioning of energy within an individual or population. Such budgets are then used to make inference about physiology or ecology in particular explaining why an organism or population does what it is observed to do assuming that energy allocation is the overriding concern. Bioenergetic modelling is an alternative method for estimating feeding rates in a natural population. These models quantify the relationship between feeding rates and growth relative to temperature, body size and activity. Bioenergetic models have been applied to address ecological questions in a wide variety of taxa.
