Recent Advances In Robotics:

Recent Advances in Robotics Gerardo Beni, Susan Hackwood, 1985 Recent Advances in Robotics and Automation Gourab Sen Gupta, Donald Bailey, Serge Demidenko, Dale Carnegie, 2013-05-23 There isn't a facet of human life that has not been touched and influenced by robots and automation. What makes robots and machines versatile is their computational intelligence. While modern intelligent sensors and powerful hardware capabilities have given a huge fillip to the growth of intelligent machines, the progress in the development of algorithms for smart interaction, collaboration, and proactiveness will result in the next quantum jump. This book deals with the recent advancements in design methodologies, algorithms, and implementation techniques to incorporate intelligence in robots and automation systems. Several articles deal with navigation, localization, and mapping of mobile robots, a problem that engineers and researchers are grappling with all the time. Fuzzy logic, neural networks, and neuro-fuzzy based techniques for real-world applications have been detailed in a few articles. This edited volume is targeted to present the latest state of the art computational intelligence techniques in Robotics and Automation. It is a compilation of the extended versions of the very best papers selected from the many that were presented at the 5th International Conference on Automation, Robotics, and Applications (ICARA 2011) which was held in Wellington, New Zealand, from 6-8 December 2011. Scientists and engineers who work with robots and automation systems will find this book very useful and stimulating.

Recent Advances in Robot Learning Judy A. Franklin, Tom M. Mitchell, Sebastian Thrun, 2012-12-06 *Recent Advances in Robot Learning* contains seven papers on robot learning written by leading researchers in the field. As the selection of papers illustrates, the field of robot learning is both active and diverse. A variety of machine learning methods, ranging from inductive logic programming to reinforcement learning, is being applied to many subproblems in robot perception and control, often with objectives as diverse as parameter calibration and concept formulation. While no unified robot learning framework has yet emerged to cover the variety of problems and approaches described in these papers and other publications, a clear set of shared issues underlies many robot learning problems. Machine learning, when applied to robotics, is situated; it is embedded into a real-world system that tightly integrates perception, decision making, and execution. Since robot learning involves decision making, there is an inherent active learning issue. Robotic domains are usually complex, yet the expense of using actual robotic hardware often prohibits the collection of large amounts of training data. Most robotic systems are real-time systems. Decisions must be made within critical or practical time constraints. These characteristics present challenges and constraints to the learning system. Since these characteristics are shared by other important real-world application domains, robotics is a highly attractive area for research on machine learning. On the other hand, machine learning is also highly attractive to robotics. There is a great variety of open problems in robotics that defy a static, hand-coded solution. *Recent Advances in Robot Learning* is an edited volume of peer-reviewed original research comprising seven invited contributions by leading researchers. This research work has also been published
