Quinolone Antibacterials Jochen Kuhlmann,A. Dalhoff,H.-J. Zeiler,2012-12-06 It has been over 30 years since the first clinically important member of the quinolone class nalidixic acid was introduced into

medical practice The modification produced in the quinolone nucleus by introducing a fluorine at the 6 position led to the discovery of the newer fluoroquinolones with enhanced antibacterial activities as compared to nalidixic acid By now a great deal of preclinical and clinical experience has been obtained with these agents The intense interest in this class of antibacterial agents by chemists micro biologists toxicologists pharmacologists clinical pharmacologists and clinicians in various disciplines encouraged us to summarize the information on the history chemistry mode of action and in vitro properties kinetics and efficacy in animals mechanisms of resistance toxicity clinical pharmacology clinical experience and future prospects in one volume of the Handbook of Experimental Pharmacology As this series deals predominantly with experimental characteristics of drugs our volume is dedicated specifically to quinolones and emphasizes principally their preclinical and clinical pharmacological characteristics despite the existence of several summaries on quinolones The chemistry of the quinolones is described in detail The chapter on the mode of action of quinolones reports the conclusive evidence that gyrase is the intracellular target of the quinolones however another enzyme topoisomerase IV may also be a target for quinolones and the exact mechanisms by which quinolones act bactericidally are far from being understood

Resolving the Antibiotic Paradox Barry P. Rosen,Shahriar Mobashery,2012-12-06 Antibiotic resistance once a term appreciated only by microbiologists has become a common topic in the popular press Stuart Levy one of the contributors to this collection bears some of the responsibility for increasing public awareness with the publication of his book The Antibiotic Paradox in 1992 Misuse of antibiotics resulting in increased bacterial resistance had previously been recognized in the infectious disease community However Dr Levy s eloquent public warning about the shrinking efficacy of our antibiotic armamentarium served to alert the lay person to the potential consequences of this demise in useful therapy Because of the proliferation of diverse antibiotic classes with increasing potency and broader activity spectra it had been assumed that any ordinary bacterial infection could be eradicated with the proper selection of drug However it has become evident that we are surrounded by resistant bacteria many of which were introduced unwittingly into our environment through the unnecessary use of antibiotics When it became evident that a number of people were returning for multiple visits to their family physicians for persistent ear infections or non responsive bronchitis questions were raised about the antibiotic treatments that were being prescribed Bacteria resistant to common antibiotic regimens were being isolated more frequently often as organisms classified as multi resistant with decreased susceptibilities to two or more structural classes of agents Nosocomial spread of these resistances was aided by the transmission of plasmid mediated resistance factors between species
