Sakita, Kosuke Oku, Tomotaka Ito, Akiyoshi Matsugi, 2025-08-12 Neuroscience based rehabilitation is called neurorehabilitation. Specifically, neurorehabilitation is defined as concepts, evaluation methods, treatments, and equipment that apply brain theories and other findings revealed by neuroscience and related research to rehabilitation. Physical dysfunction, including central nervous system disease, alters the body's representation in the brain, resulting in stagnation of motor function recovery. Therefore, neuroscience based rehabilitation is essential to reconstruct the altered body representation in the brain. However, the evidence for neurorehabilitation is still insufficient, and it is critical to build upon this evidence to provide optimal rehabilitation and maximize motor function recovery. Many fundamental studies on neuroplasticity, motor control, and motor learning theory, brain function measurement, non-invasive brain stimulation, and advanced technologies such as brain-machine interface, AI, and regenerative medicine have been reported in recent years. The integration of neuroscience and cutting-edge research related to neuroscience has excellent potential to contribute to the development of neurorehabilitation.
