Recent Advances In Multireference Methods:

Recent Advances In Multireference Methods Kimihiko Hirao, 1999-02-04 Recently accurate ab initio quantum computational chemistry has evolved dramatically. In particular, the development of multireference based approaches has opened up a whole new area and has also had a profound impact on the potential of theoretical chemistry. The multiconfigurational SCF MCSCF CASSCF method is an attempt to generalize the Hartree Fock HF model and to treat real chemical processes where nondynamic correlation is important while keeping the conceptual simplicity of the HF model as much as possible. Although MCSCF CASSCF itself does not include dynamic correlations, it provides a good starting point for such studies. There are three approaches to handling dynamic correlations: Beginning with the MSSCF CASSCF wave function, they are the variational MRCI, perturbational MRPT, and cluster expansion MRCC approaches. This important book presents the most recent and important developments in multireference based approaches and their applications. Its main purpose is to highlight essential aspects of the frontiers of multireference theory and provide readers with the fundamental knowledge necessary for further development.

Recent Advances in Coupled-cluster Methods Rodney J. Bartlett, 1997. Today coupled cluster CC theory has emerged as the most accurate, widely applicable approach for the correlation problem in molecules. Furthermore, the correct scaling of the energy and wavefunction with size, i.e., extensivity, recommends it for studies of polymers and crystals as well as molecules. CC methods have also paid dividends for nuclei and for certain strongly correlated systems of interest in field theory. In order for CC methods to have achieved this distinction, it has been necessary to formulate new theoretical approaches for the treatment of a variety of essential quantities. These include properties and particularly analytical first derivatives, gradients that readily provide the forces on the atoms in a molecule to facilitate searching potential energy surfaces for structures and transition states, second derivatives, Hessians which indicate the type of extremum point and provide vibrational frequencies and intensities, excited, ionized, and electron attached states including

their properties multi configurational reference functions to add important non dynamic correlation and relativistic effects This book addresses very recent work in each of the above topics in ten chapters written by leading experts in molecular CC theory This is NOT a collection of reviews but is instead forefront research explained in an unusually clear exposition Each chapter presents new results and formulations that offer another step toward providing the next generation of powerful CC solutions The gap that often exists between text books and research can be more of a chasm in highly technical fields like CC theory but this volume helps to fill the void as it provides a sequel to a graduate level course in CC theory and many electron methods Essentially all current directions for new research are well represented in the authoritative articles

Computational Chemistry: Reviews Of Current Trends, Vol. 4 Shridhar R Gadre, Kimihiko Hirao, Jerzy Leszczynski, Mark A Olson, Modesto Orozco, Peter Politzer, Luis Seijo, 1999-11-05 This volume presents a balanced blend of methodological and applied contributions It supplements well the first three volumes of the series revealing results of current research in computational chemistry It also reviews the topographical features of several molecular scalar fields A brief discussion of topographical concepts is followed by examples of their application to several branches of chemistry The size of a basis set applied in a calculation determines the amount of computer resources necessary for a particular task The details of a common strategy the ab initio model potential method which could be used to minimize such a task are revealed in the subsequent contribution Such an approach is applied to atoms molecules and solids Two chapters are devoted to the prediction of solvent effects in biological systems These effects are significant for interactions of nucleic acid bases and crucial for an evaluation of the free energies that govern the associations of macromolecules in aqueous solutions A chapter on the developments and applications of the multireference Moller Plesset method could be used as a reference in theoretical studies of systems where both the dynamical and nondynamical correlation effects should be accounted for This technique is an efficient tool in such investigations An explosive application of computational techniques studies of detonation initiation and sensitivity in energetic compounds is discussed in detail in the last chapter The computational treatment of such unstable compounds allows the prediction of their crucial properties without being subject to their destructive forces

Recent Advances In Density Functional Methods, Part II Delano Pun Chong, 1997-05-14 Of all the different areas in computational chemistry density functional theory DFT enjoys the most rapid development Even at the level of the local density approximation LDA which is computationally less demanding DFT can usually provide better answers than Hartree Fock formalism for large systems such as clusters and solids For atoms and molecules the results from DFT often rival those obtained by ab initio quantum chemistry partly because larger basis sets can be used Such encouraging results have in turn stimulated workers to further investigate the formal theory as well as the computational methodology of DFT This Part II expands on the methodology and applications of DFT Some of the chapters report on the latest developments since the publication of Part I in 1995 while others extend the applications to wider range of molecules and their environments Together this and other recent review volumes on DFT show that DFT provides an efficient and accurate alternative to traditional quantum chemical methods Such demonstration should hopefully stimulate fruitful developments in formal theory better exchange correlation functionals and linear scaling methodology Computational Chemistry Jerzy Leszczynski, 1999 A blend of methodological and applied contributions on computational chemistry It explores research results and the topographical features of several molecular scalar fields A discussion of topographical concepts is followed by examples of

their application to several branches of chemistry
