Recent Research Towards Advanced Man-Machine Interface Through Spoken Language H. Fujisaki, 1996-10-24

The spoken language is the most important means of human information transmission. Thus as we enter the age of the Information Society the use of the man machine interface through the spoken language becomes increasingly important. Due to the extent of the problems involved however full realization of such an interface calls for coordination of research efforts beyond the scope of a single group or institution. Thus a nationwide research project was conceived and started in 1987 as one of the first Priority Research Areas supported by the Ministry of Education Science and Culture of Japan. The project was carried out in collaboration with over 190 researchers in Japan. The present volume begins with an overview of the project followed by 41 papers presented at the symposia. This work is expected to serve as an important source of information on each of the nine topics adopted for intensive study under the project. This book will serve as a guideline for further work in the important scientific and technological field of spoken language processing.

Behavioral Biometrics Kenneth Revett, 2008-09-15 With the advent of the internet as a medium for performing business transactions the need for a secure communication channel has never been more paramount. The study of behavioral biometrics the verification and or identification of individuals based on the way they provide information to an authentication system originated from the need for a small footprint versatile alternative to expensive hardware based or physiological biometrics. As an emerging alternative to these traditional and more well known physiological biometrics such as fingerprinting or iris scans behavioral biometrics can offer state of the art solutions to identity management requirements as either a stand alone system or part of a multi biometric security system. Whilst there are many existing texts that focus on physiological biometrics or algorithmic approaches deployed in biometrics Behavioral Biometrics addresses a gap in the existing literature for a text that is solely dedicated to the topic of behavioral biometrics. The author presents a thorough analysis of the latest research into well known techniques such as signature verification and voice recognition as well more recently developed and ground breaking techniques including keyboard mouse dynamics gait analysis odour analysis and salinity testing which are ever increasing in reliability. It discusses exciting future trends that focus on the brain computer interface using EEG technology and may one day enable human machine interaction via brainwave patterns. It describes the central applications for the technology within e commerce and related industries and provides a number of comprehensive case studies of major implementations that provide the user with a strong sense of the approaches employed in the various subdomains of behavioral biometrics. It provides a comprehensive glossary of terms as well as a rich set of references and websites that enable the reader to explore and augment topics as required. Behavioral Biometrics will appeal to graduate and postgraduate students as well as researchers wishing to explore this fascinating research topic in areas of biometrics and computer science including
