Written by an expert group of authors this text is a comprehensive and authoritative guide for neuropsychologists who engage in forensic work [Neuropsychological Testing: From Psychometrics to Clinical Neuropsychology](#) Alessio Facchin, Elisa Cavicchiolo, Edgar Chan, 2025-02-10 Neuropsychological testing represents an essential part of the clinical examination of neuropsychological patients and these measures remain the primary instrument for clinical research in neuropsychology. For these reasons old procedures were psychometrically investigated to assess their metrical properties. As a result of the redesigned procedures old tests were improved in terms of their psychometric properties and characteristics. The field of neuropsychological testing needs to be updated with new research in order to improve the clinical practice of neuropsychological testing the psychometric characteristics of new neuropsychological tests and the theories behind the testing in a circular way. In this research topic we want to report recent advances and changes from old standard diagnostic testing to more recent procedures and methods in the area of cognitive testing. Applications comparisons novel definitions and measures updated procedures and psychometric properties of existing instruments measurement invariance reliability repeatability specific norms particular applications and use in specific patients are all welcome. Open access tests methods and procedures are encouraged together with studies that follow the Open Science initiative. This topic joins two different backgrounds in this area of research psychometrics and neuropsychology and all studies in these areas will be considered included reviews and meta analyses.

### **Neuropsychological Assessment in the Age of Evidence-Based Practice**

Stephen C. Bowden, 2017-01-26 Evidence based practice has become the benchmark for quality in healthcare and builds on rules of evidence that have been developed in psychology and other health care disciplines over many decades. This volume aims to provide clinical neuropsychologists with a practical and approachable reference for skills in evidence based practice to improve the scientific status of patient care. The core skills involve techniques in critical appraisal of published diagnostic validity or treatment studies. Critical appraisal skills assist any clinician to evaluate the scientific status of any published study to identify the patient relevance of studies with good scientific status and to calculate individual patient probability estimates of diagnosis or treatment outcome to guide practice. Initial chapters in this volume review fundamental concepts of construct validity relevant to the assessment of psychopathology and cognitive abilities in neuropsychological populations. These chapters also summarize exciting contemporary development in the theories of personality and psychopathology and cognitive ability showing a convergence of theoretical and clinical research to guide clinical practice. Conceptual skills in interpreting construct validity of neuropsychological tests are described in detail in this volume. In addition a non mathematical description of the concepts of test score reliability and the neglected topic of interval estimation for individual assessment is provided. As an extension of the concepts of reliability reliable change indexes are reviewed and the implication of impact on evidence based practice of test scores reliability and reliable change are described to guide clinicians in their interpretation of test results on single or repeated assessments. Written by some of the foremost experts in the field of clinical neuropsychology and with practical and concrete examples throughout this volume shows how evidence based practice is enhanced by reference to good theory strong construct validity and better test score reliability.
