This two volume work is a testament to the abiding interest and human fascination with ammonites We offer a new model to explain the morphogenesis of septa and the shell we explore their habitats by the content of stable isotopes in their shells we discuss the origin and later evolution of this important clade and we deliver hypotheses on its demise The Ammonoidea produced a great number of species that can be used in biostratigraphy and possibly this is the macrofossil group which has been used the most for that purpose Nevertheless many aspects of their anatomy mode of life development or paleobiogeographic distribution are still poorly known Themes treated are biostratigraphy paleoecology paleoenvironment paleobiogeography evolution phylogeny and ontogeny Advances such as an explosion of new information about ammonites new technologies such as isotopic analysis tomography and virtual paleontology in general as well as continuous discovery of new fossil finds have given us the opportunity to present a comprehensive and timely state of the art compilation Moreover it also points the way for future studies to further enhance our understanding of this endlessly fascinating group of organisms **Advancing Research on**

Living and Fossil Cephalopods Federico Olóriz, Francisco J. One of the most important functions of paleontology in the earth sciences is time correlation of rock strata using taxonomic analysis of fossils in different regions Comparisons of certain species similarities between regions frequently allows for precise age dating and correlation of strata limited only by the presence absence of species and the speed at which they evolved Between their first appearance in the early middle Devonian and their ultimate extinction at the K T boundary no other single taxonomic group is as precise or as widely useful

for time correlation of strata as the ammonoid cephalopods an extinct distant relative of the modern chambered nautilus This is especially true for the Carboniferous Era where ammonoid change was extremely rapid for reasons that are as yet not fully known although global climate fluctuation is probably a key driving force
