Mathematical Modelling Of Industrial Processes Lecture Notes In Mathematics Volume 1521:

Integral Geometry, Radon Transforms and Complex Analysis Carlos A. Berenstein, Peter F. Ebenfelt, Simon Gindikin, Sigurdur Helgason, Alexander Tumanov, 1998-04-16 This book contains the notes of five short courses delivered at the Centro Internazionale Matematico Estivo session Integral Geometry Radon Transforms and Complex Analysis held in Venice Italy in June 1996 three of them deal with various aspects of integral geometry with a common emphasis on several kinds of Radon transforms their properties and applications the other two share a stress on CR manifolds and related problems All lectures are accessible to a wide audience and provide self contained introductions and short surveys on the subjects as well as detailed expositions of selected results **Flows on 2-dimensional Manifolds** Igor Nikolaev, Evgeny Zhuzhoma, 1999-07-15 Time evolution in low dimensional topological spaces is a subject of puzzling vitality This book is a state of the art account covering classical and new results The volume comprises Poincaré Bendixson local and Morse Smale theories as well as a carefully written chapter on the invariants of surface flows Of particular interest are chapters on the Anosov Weil problem C algebras and non compact surfaces The book invites graduate students and non specialists to a fascinating realm of research It is a valuable source of reference to the specialists **Elliptic Genera and Vertex Operator Super-Algebras** Hirotaka Tamanoi, 1999-06-21 This monograph deals with two aspects of the theory of elliptic genus its topological aspect involving elliptic functions and its representation theoretic aspect involving vertex operator super algebras For the second aspect elliptic genera are shown to have the structure of modules over certain vertex operator super algebras The vertex operators corresponding to parallel tensor fields on closed Riemannian Spin Kähler manifolds such as Riemannian tensors and Kähler forms are shown to give rise to Virasoro algebras and affine Lie algebras This monograph is chiefly intended for topologists and it includes accounts on topics outside of topology such as vertex operator algebras **The Red Book of Varieties and Schemes** David Mumford, 2004-02-21 Mumford's famous Red Book gives a simple readable account of the basic objects of algebraic geometry preserving as much as possible their geometric flavor and integrating this with the tools of commutative algebra It is aimed at graduates or mathematicians in other fields wishing to quickly learn about algebraic geometry This new edition includes an appendix that gives an overview of the theory of curves their moduli spaces and their Jacobians one of the most exciting fields within algebraic geometry *Projective Modules and Complete Intersections* Satya Mandal, 1997-10-10 In these notes on Projective Modules and Complete Intersections an account on the recent developments in research on this subject is presented The author's preference for the technique of Patching isotopic isomorphisms due to Quillen formalized by Plumsted over the techniques of elementary matrices is evident here The treatment of Basic Element theory here incorporates Plumstead's idea of the generalized dimension functions These notes are highly self-contained and should be accessible to any graduate student in commutative algebra or algebraic geometry They include fully self contained presentations of the theorems of Ferrand Szapiro Cowsik Nori and the techniques

 Grosshans, 1997-11-18 The invariant theory of non reductive groups has its roots in the 19th century but has seen some very
 interesting developments in the past twenty years This book is an exposition of several related topics including observable
 subgroups induced modules maximal unipotent subgroups of reductive groups and the method of U invariants and the
 complexity of an action Much of this material has not appeared previously in book form The exposition assumes a basic
 knowledge of algebraic groups and then develops each topic systematically with applications to invariant theory Exercises
 are included as well as many examples some of which are related to geometry and physics **Tomita-Takesaki Theory in
 Algebras of Unbounded Operators** Atsushi Inoue, 1998-11-18 These notes are devoted to a systematic study of developing
 the Tomita Takesaki theory for von Neumann algebras in unbounded operator algebras called O algebras and to its
 applications to quantum physics The notions of standard generalized vectors and standard weights for an O algebra are
 introduced and they lead to a Tomita Takesaki theory of modular automorphisms The Tomita Takesaki theory in O algebras is
 applied to quantum moment problem quantum statistical mechanics and the Wightman quantum field theory This will be of
 interest to graduate students and researchers in the field of unbounded operator algebras and mathematical physics
