Immunology and Epidemiology Geoffrey W. Hoffmann, Tomas Hraba, 2013-06-29 In February 1985 a small international meeting of scientists took place at the recreation resort of the Polish Academy of Sciences in Mogilany near Cracow Poland The initiative for holding the workshop came from a working meeting on mathematical immunology and related topics at the International Institute for Applied Systems Analysis in Laxenburg Austria in November 1983 In addition to representatives of IIASA delegates of the IIASA National Member Organizations NMO of Czechoslovakia Italy and the Soviet Union took part in that working meeting The participants came to the conclusion that IIASA could play an important role in facilitating the development of research in this field The first step that they recommended to IIASA was to organize a workshop on mathematical immunology The purpose of the workshop was to review the progress that has been made in applying mathematics to problems in immunology and to explore ways in which further progress might be achieved especially by more efficient interactions between scientists working in mathematical and experimental immunology Some National Member Organizations contributed to the success of the workshop by nominating further participants working in this or related fields For instance thanks to a suggestion of the British NMO the meeting also included analyses of the interactions between the immune state of a population and epidemiological phenomena There were 33 participants at Mogilany from 11 countries namely Canada Czechoslovakia Federal Republic of Germany Hungary Japan Netherlands Poland Sweden United Kingdom USA and USSR

Model Development and Optimization V.V. Ivanov, 2013-11-09 At present concerning intensive development of computer hardware and software computer based methods for modeling of difficult problems have become the main technique for theoretical and applied investigations Many unsolved tasks for evolutionary systems ES are an important class of such problems ES relate to economic systems on the whole and separate branches and businesses scientific and art centers ecological systems populations separate species of animals and plants human organisms different subsystems of organisms cells of animals and plants and soon Available methods for modeling of complex systems have received considerable attention and led to significant results No large scale programs are done without methods of modeling today Power programs health programs cosmos investigations economy designs etc are a few examples of such programs Nevertheless in connection with the permanent complication of contemporary problems existing means are in need of subsequent renovation and perfection In the monograph along with analysis of contemporary means new classes of mathematical models MM which can be used for modeling in the most difficult cases are proposed and justified The main peculiarities of these MM offer possibilities for the description of ES creation and restoration processes dynamics of elimination or reservation of obsolete technology in ES dynamics of resources distribution for fulfillment of internal and external functions of ES and so on The complexity of the problems allows us to refer to the theory and applications of these MM as the mathematical theory of development For simplicity the title Model Development and Optimization was adopted

Hamoudi, Daniel Olive, Lucia Conti, Alexander John MacRobert, 2024-01-02 *Systems Biology Approaches to Understanding the Cause and Treatment of Heart, Lung, Blood, and Sleep Disorders* Raimond L Winslow, Jennie Larkin, Pankaj Qasba, 2014-11-21 Development of powerful new high throughput technologies for probing the transcriptome proteome and metabolome is driving the rapid acquisition of information on the function of molecular systems The importance of these achievements cannot be understated they have transformed the nature of both biology and medicine Despite this dramatic progress one of the greatest challenges that continues to confront modern biology is to understand how behavior at the level of genome proteome and metabolome determines physiological function at the level of cell tissue and organ in both health and disease Because of the inherent complexity of biological systems the development analysis and validation of integrative computational models based directly on experimental data is necessary to achieve this understanding This approach known as systems biology integrates computational and experimental approaches through iterative development of mathematical models and experimental validation and testing The combination of these approaches allows for a mechanistic understanding of the function of complex biological systems in health and their dysfunction in disease The National Heart Lung and Blood Institute NHLBI has recognized the importance of the systems biology approach for understanding normal physiology and perturbations associated with heart lung blood and sleep diseases and disorders In 2006 NHLBI announced the Exploratory Program in Systems Biology followed in 2010 by the NHLBI Systems Biology Collaborations The goal of these programs is to support collaborative teams of investigators in using experimental and computational strategies to integrate the component parts of biological networks and pathways into computational models that are based firmly on and validated using experimental data These validated models are then applied to gain insights into the mechanisms of altered system function in disease to generate novel hypotheses regarding these mechanisms that can be tested experimentally and to then use the results of experiments to refine the models The purpose of this Research Topic is to present the range of innovative new approaches being developed by investigators working in areas of systems biology that couple experimental and modeling studies to understand the cause and possible treatment of heart lung blood and sleep diseases and disorders This Research Topic will be of great interest to the cardiovascular research community as well as to the general community of systems biologists

Neuroimmune Diseases Hiroshi Mitoma, Mario Manto, 2024-11-18 This Springer Major Reference Work provides a detailed translational overview of neuroimmune diseases for neuroscientists and clinicians clarifying the pathological mechanisms underlying neuroimmune diseases and building a comprehensive bridge between the latest research findings and their clinical implications in daily practice The material is presented in two steps The first section comprises a review of the pathogenic actions of immune cells in brain diseases Here the authors discuss the mechanisms through which immune cells disrupt the functions of nerve cells The second section explores the ways in which the brain becomes dysfunctional due to impaired nerve cell function Based on pathogenesis diagnostic and therapeutic strategies are

discussed for each clinical category The new edition features updated chapters throughout including coverage of new findings new diagnostic criteria and therapeutic algorithms Neuroimmune Diseases 2nd edition also includes new chapters with a translational approach The book will be invaluable for use in clinical practice of neuroimmune diseases
