Reinforced Concrete Slabs Under Impact Loading Faham Tahmasebinia,2011-04 Many older structures were designed
for static loads but more recently there has been a growing awareness that some must be designed to resist both dynamic
impact and static loads An accidental impact load can be caused by mishaps in industry as well as accidents stemming from
transportation or man made disasters Structural components can be subjected to a range of deliberate impact loads such as
military activity or terrorist attacks A large proportion of the surfaces of concrete structures are covered by reinforced
concrete slabs Slabs are often slender elements which means they are vulnerable to flexural shear or a combination of both
modes of failure when subjected to impact loading There are a number of ways of predicting how an impact load will affect a
concrete slab some of which may be impractical or expensive but because there have been significant developments in
technology numerical techniques rather than experimental approaches have become popular methods for developing detailed
