Developments in Reliable Computing Tibor Csendes, 2013-04-17 The SCAN conference the International Symposium on Scientific Computing Computer Arithmetic and Validated Numerics takes place biannually under the joint

auspices of GAMM Gesellschaft für Angewandte Mathematik und Mechanik and IMACS International Association for Mathematics and Computers in Simulation SCAN 98 attracted more than 100 participants from 21 countries all over the world During the four days from September 22 to 25 nine highlighted plenary lectures and over 70 contributed talks were given These figures indicate a large participation which was partly caused by the attraction of the organizing country Hungary but also the effective support system have contributed to the success The conference was substantially supported by the Hungarian Research Fund OTKA GAMM the National Technology Development Board OMFB and by the József Attila University Due to this funding it was possible to subsidize the participation of over 20 scientists mainly from Eastern European countries It is important that the possibly first participation of 6 young researchers was made possible due to the obtained support The number of East European participants was relatively high These results are especially valuable since in contrast to the usual 2 years period the present meeting was organized just one year after the last SCAN xx conference

Artificial Neural Nets and Genetic Algorithms Rudolf F. Albrecht, Colin R. Reeves, Nigel C. Steele, 2012-12-06 Artificial neural networks and genetic algorithms both are areas of research which have their origins in mathematical models constructed in order to gain understanding of important natural processes By focussing on the process models rather than the processes themselves significant new computational techniques have evolved which have found application in a large number of diverse fields This diversity is

reflected in the topics which are the subjects of contributions to this volume There are contributions reporting theoretical developments in the design of neural networks and in the management of their learning In a number of contributions applications to speech recognition tasks control of industrial processes as well as to credit scoring and so on are reflected Regarding genetic algorithms several methodological papers consider how genetic algorithms can be improved using an experimental approach as well as by hybridizing with other useful techniques such as tabu search The closely related area of classifier systems also receives a significant amount of coverage aiming at better ways for their implementation Further while there are many contributions which explore ways in which genetic algorithms can be applied to real problems nearly all involve some understanding of the context in order to apply the genetic algorithm paradigm more successfully That this can indeed be done is evidenced by the range of applications covered in this volume

Reliable Plan Selection By Intelligent Machines John E McInroy, Joseph C Musto, George N Saridis, 1996-02-29 This book derives techniques which allow reliable plans to be automatically selected by Intelligent Machines It concentrates on the uncertainty analysis of candidate plans so that a highly reliable candidate may be identified and used For robotic components such as a particular vision algorithm for pose estimation or a joint controller methods are explained for directly calculating the reliability However these methods become excessively complex when several components are used together to complete a plan Consequently entropy minimization techniques are used to estimate which complex tasks will perform reliably The book first develops tools for directly calculating the reliability of sub systems and methods of using entropy minimization to greatly facilitate the analysis are explained Since these sub systems are used together to accomplish complex tasks the book then explains how complex tasks can be efficiently evaluated

Ab initio Calculation Tutorial Ryo Maezono, 2023-05-16 This textbook covers the framework of first principles analysis applied to materials using density functional theory DFT It provides a set of hands on tutorials using the Quantum ESPRESSO package an open source software for DFT The tutorials are well chosen designed for maximum effectiveness while requiring a minimum of the reader s time and the book describes how the essential components are combined to create the practical applications based on the idea of modeling practical problems of materials The book carefully explains how to prepare the platform to run the tutorials assisted by free software This textbook is useful for students in experimental laboratories for industrial researchers and for those not majoring in theoretical studies but learning individually

Advances in Reliable Numerical Computation M. G. Cox, National Physical Laboratory (Great Britain). Division of Information Technology and Computing, 1987

Solving Fault Diagnosis Problems Andreas Varga, 2017-02-14 This book addresses fault detection and isolation topics from a computational perspective Unlike most existing literature it bridges the gap between the existing well developed theoretical results and the realm of reliable computational synthesis procedures The model based approach to fault detection and diagnosis has been the subject of ongoing research for the past few decades While the theoretical aspects of fault diagnosis on the basis of linear models are well understood most of the

computational methods proposed for the synthesis of fault detection and isolation filters are not satisfactory from a numerical standpoint Several features make this book unique in the fault detection literature Solution of standard synthesis problems in the most general setting for both continuous and discrete time systems regardless of whether they are proper or not consequently the proposed synthesis procedures can solve a specific problem whenever a solution exists Emphasis on the best numerical algorithms to solve the synthesis problems for linear systems in generalized state space form also known as descriptor systems Development of general synthesis procedures relying on new computational paradigms such as factorization based design based on filter updating techniques and nullspace based synthesis Availability of a comprehensive set of free accompanying software tools for descriptor systems which allows readers to easily implement all synthesis procedures presented in the book and ensures that all results are reproducible This book is primarily intended for researchers and advanced graduate students in the areas of fault diagnosis and fault tolerant control It will also appeal to mathematicians with an interest in control oriented numerics
