**Mathematical Models And Methods For Smart Materials** Mauro Fabrizio, Barbara Lazzari, Angelo Morro, 2002-12-16  
This book contains the papers presented at the conference on Mathematical Models and Methods for Smart Materials held in Italy in 2001. The papers are divided into four parts. Methods in Materials Science deals mainly with mathematical techniques for the investigation of physical systems such as liquid crystals, materials with internal variables, amorphous materials, and thermoelastic materials. Also techniques are exhibited for the analysis of stability and controllability of classical models of continuum mechanics and of dynamical systems. Modelling of Smart Materials is devoted to models of superfluids, superconductors, materials with memory, nonlinear elastic solids, and damaged materials. In the elaboration of the models, thermodynamic aspects play a central role in the characterization of the constitutive properties. Well-Posedness in Materials with Memory deals with existence, uniqueness, and stability for the solution of problems most often expressed by integrodifferential equations which involve materials with fading memory. Also attention is given to exponential decay in viscoelasticity, inverse problems in heat conduction with memory, and automatic control for parabolic equations. Analytic Problems in Phase Transitions discusses nonlinear partial differential equations associated with phase transitions and hysteresis, possibly involving fading memory effects. Particular applications are developed for the phase field model with memory, the Stefan problem with a Cattaneo type equation, the hysteresis in thermo-visco-plasticity, and the solid-solid phase transition. *Mathematical Models and Methods for Smart Materials*, 2002

**Smart Material Systems** Ralph C. Smith, 2005-03-01  
This book describes several novel applications currently under investigation that exploit the unique actuator and sensor capabilities of smart material compounds. In addition to present and projected applications, this book provides comprehensive coverage of both linear and nonlinear modeling techniques necessary to characterize materials in a manner that facilitates transducer design and control development. The author focuses on ferroelectric, magnetic, and shape memory compounds and also addresses applications exploiting amorphous and ionic polymers, magnetorheological compounds, and fiber optic sensors. By providing a unified treatment of both linear and nonlinear characterization frameworks, Smart Material Systems Model Development encompasses both low to moderate drive levels, which constitute the primary focus of most present texts, and the high drive regimes dictated by present and future applications. This will significantly enhance the design of transducers and control systems which exploit the unique actuator and sensor capabilities provided by smart material compounds. *Mathematical Models and Methods*, 1983
