difference equation $\dot{X} = B(t)X$ or $X(t) = B(t)X(0)$ to a random differential equation $\dot{X} = B(t)X$ or random difference equation $X_{n+1} = B_n X_n$. Both components have been very well investigated separately. However a symbiosis of them leads to a new research program which has only partly been carried out. As we will see it also leads to new problems which do not emerge if one only looks at ergodic theory and smooth or topological dynamics separately. From a dynamical systems point of view this book just deals with those dynamical systems that have a measure preserving dynamical system as a factor or the other way around are extensions of such a factor. As there is an invariant measure on the factor ergodic theory is always involved. **Random**

Matrices Alexei Borodin, Ivan Corwin, Alice Guionnet, 2019-10-30 Random matrix theory has many roots and many branches in mathematics statistics physics computer science data science numerical analysis biology ecology engineering and operations research. This book provides a snippet of this vast domain of study with a particular focus on the notations of universality and integrability. Universality shows that many systems behave the same way in their large scale limit while integrability provides a route to describe the nature of those universal limits. Many of the ten contributed chapters address these themes while others touch on applications of tools and results from random matrix theory. This book is appropriate for graduate students and researchers interested in learning techniques and results in random matrix theory from different perspectives and viewpoints. It also captures a moment in the evolution of the theory when the previous decade brought major break throughs prompting exciting new directions of research. On Mesoscopic Equilibrium for Linear Statistics in

Dyson's Brownian Motion Maurice Duits, Kurt Johansson, 2018-10-03 In this paper the authors study mesoscopic fluctuations for Dyson's Brownian motion with 2. Dyson showed that the Gaussian Unitary Ensemble GUE is the invariant measure for this stochastic evolution and conjectured that when starting from a generic configuration of initial points the time that is needed for the GUE statistics to become dominant depends on the scale we look at. The microscopic correlations arrive at the equilibrium regime sooner than the macroscopic correlations. The authors investigate the transition on the intermediate i.e. mesoscopic scales. The time scales that they consider are such that the system is already in microscopic equilibrium since universality for the local correlations but have not yet reached equilibrium at the macroscopic scale. The authors describe the transition to equilibrium on all mesoscopic scales by means of Central Limit Theorems for linear statistics with sufficiently smooth test functions. They consider two situations deterministic initial points and randomly chosen initial points. In the random situation they obtain a transition from the classical Central Limit Theorem for independent random variables to the one for the GUE. **Séminaire de Probabilités LII** Catherine Donati-Martin, Antoine Lejay, Alain Rouault, 2025-07-14 The last

Random Walks on Reductive Groups Yves Benoist, Jean-François Quint, 2016-10-20 The classical theory of random walks describes the asymptotic behavior of sums of independent identically distributed random real variables This book explains the generalization of this theory to products of independent identically distributed random matrices with real coefficients Under the assumption that the action of the matrices is semisimple or equivalently that the Zariski closure of the group generated by these matrices is reductive and under suitable moment assumptions it is shown that the norm of the products of such random matrices satisfies a number of classical probabilistic laws This book includes necessary background on the theory of reductive algebraic groups probability theory and operator theory thereby providing a modern introduction to the topic

Mathematical Physics 2000 Athanassios Fokas, Alexander Grigoryan, Tom Kibble, Boguslaw Zegarlinski, 2000-05-05 Mathematical physics has made enormous strides over the past few decades with the emergence of many new disciplines and with revolutionary advances in old disciplines One of the especially interesting features is the link between developments in mathematical physics and in pure mathematics Many of the exciting advances in mathematics owe their origin to mathematical physics superstring theory for example has led to remarkable progress in geometry while very pure mathematics such as number theory has found unexpected applications The beginning of a new millennium is an appropriate time to survey the present state of the field and look forward to likely advances in the future In this book leading experts give personal views on their subjects and on the wider field of mathematical physics The topics covered range widely over the whole field from quantum field theory to turbulence from the classical three body problem to non equilibrium statistical mechanics
